License Agreement

Permission is hereby granted by the Open Geospatial Consortium, ("Licensor"), free of charge and subject to the terms set forth below, to any person obtaining a copy of this Intellectual Property and any associated documentation, to deal in the Intellectual Property without restriction (except as set forth below), including without limitation the rights to implement, use, copy, modify, merge, publish, distribute, and/or sublicense copies of the Intellectual Property, and to permit persons to whom the Intellectual Property is furnished to do so, provided that all copyright notices on the intellectual property are retained intact and that each person to whom the Intellectual Property is furnished agrees to the terms of this Agreement.

If you modify the Intellectual Property, all copies of the modified Intellectual Property must include, in addition to the above copyright notice, a notice that the Intellectual Property includes modifications that have not been approved or adopted by LICENSOR.

THIS LICENSE IS A COPYRIGHT LICENSE ONLY, AND DOES NOT CONVEY ANY RIGHTS UNDER ANY PATENTS THAT MAY BE IN FORCE ANYWHERE IN THE WORLD.

THE INTELLECTUAL PROPERTY IS PROVIDED "AS IS", WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NONINFRINGEMENT OF THIRD PARTY RIGHTS. THE COPYRIGHT HOLDER OR HOLDERS INCLUDED IN THIS NOTICE DO NOT WARRANT THAT THE FUNCTIONS CONTAINED IN THE INTELLECTUAL PROPERTY WILL MEET YOUR REQUIREMENTS OR THAT THE OPERATION OF THE INTELLECTUAL PROPERTY WILL BE UNINTERRUPTED OR ERROR FREE. ANY USE OF THE INTELLECTUAL PROPERTY SHALL BE MADE ENTIRELY AT THE USER'S OWN RISK. IN NO EVENT SHALL THE COPYRIGHT HOLDER OR ANY CONTRIBUTOR OF INTELLECTUAL PROPERTY RIGHTS TO THE INTELLECTUAL PROPERTY BE LIABLE FOR ANY CLAIM, OR ANY DIRECT, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, OR ANY DAMAGES WHATSOEVER RESULTING FROM ANY ALLEGED INFRINGEMENT OR ANY LOSS OF USE, DATA OR PROFITS, WHETHER IN AN ACTION OF CONTRACT, NEGLIGENCE OR UNDER ANY OTHER LEGAL THEORY, ARISING OUT OF OR IN CONNECTION WITH THE IMPLEMENTATION, USE, COMMERCIALIZATION OR PERFORMANCE OF THIS INTELLECTUAL PROPERTY.

This license is effective until terminated. You may terminate it at any time by destroying the Intellectual Property together with all copies in any form. The license will also terminate if you fail to comply with any term or condition of this Agreement. Except as provided in the following sentence, no such termination of this license shall require the termination of any third party end-user sublicense to the Intellectual Property which is in force as of the date of notice of such termination. In addition, should the Intellectual Property, or the operation of the Intellectual Property, infringe, or in LICENSOR's sole opinion be likely to infringe, any patent, copyright, trademark or other right of a third party, you agree that LICENSOR, in its sole discretion, may terminate this license without any compensation or liability to you, your licensees or any other party. You agree upon termination of any kind to destroy or cause to be destroyed the Intellectual Property together with all copies in any form, whether held by you or by any third party.

Except as contained in this notice, the name of LICENSOR or of any other holder of a copyright in all or part of the Intellectual Property shall not be used in advertising or otherwise to promote the sale, use or other dealings in this Intellectual Property without prior written authorization of LICENSOR or such copyright holder. LICENSOR is and shall at all times be the sole entity that may authorize you or any third party to use certification marks, trademarks or other special designations to indicate compliance with any LICENSOR standards or specifications. This Agreement is governed by the laws of the Commonwealth of Massachusetts. The application to this Agreement of the United Nations Convention on Contracts for the International Sale of Goods is hereby expressly excluded. In the event any provision of this Agreement shall be deemed unenforceable, void or invalid, such provision shall be modified so as to make it valid and enforceable, and as so modified the entire Agreement shall remain in full force and effect. No decision, action or inaction by LICENSOR shall be construed to be a waiver of any rights or remedies available to it.

i. Abstract

The CityGML 3.0 GML Encoding Standard presents the implementation-dependent, GML encoding of the concepts defined by the CityGML 3.0 Conceptual Model(CM) standard. Those concepts include the most relevant topographic objects in cities and regional models with respect to their geometrical, topological, semantical, and appearance properties. “City” is broadly defined to comprise not just built structures, but also elevation, vegetation, water bodies, city furniture, and more. Included are generalization hierarchies between thematic classes, aggregations, relations between objects, and spatial properties.

CityGML is an implementation of the CityGML 3.0 Conceptual Model Standard. [Table 1](#) maps requirements classes from the CityGML conceptual model into the implementation details documented in this standard.

Table 1. Conceptual Model Mapping

Conceptual Model	Section	GML Schema
ADE	Section 6.2	core.xsd
Appearance	Section 6.3	appearance.xsd
Bridge	Section 6.4	bridge.xsd
Building	Section 6.5	building.xsd
City Furniture	Section 6.6	cityFurniture.xsd

ii. Keywords

The following are keywords to be used by search engines and document catalogues.

ogcdoc, OGC document, CityGML, 3D city models, GML, XML

iii. Preface

In order to achieve consensus on the basic entities, attributes, and relations of a 3D city model, a UML Conceptual Model, CityGML 3.0, was approved as an OGC standard in March, 2021. This model provides a unifying conceptual basis for city model encoding standards. This cityGML 3.0 XML Encoding Standard defines how those concepts should be realized using XML and GML technologies.

As an OGC standard, CityGML follows the OGC modular specification standard, OGC 08-131r3. Because of the breadth of CityGML, its conceptual model was divided into separate Requirements Classes, one for each subject area. This CityGML encoding similarly is divided into Requirements Classes which are then grouped into Parts. A Part may address multiple CityGML Requirements Classes but each Requirements Class is addressed in a single part. Because Requirements Classes may depend on other Requirements Classes the reader of this CityGML Part may need to conform to Requirements Classes in other Parts as well.

Note that this CityGML encoding standard is a standardization target of the CityGML 3.0 Conceptual Model Standard. Therefore this standard conforms to the Conformance Classes in that standard. Evidence of that conformance is provided in [Appendix D](#). On the other hand, an application claiming conformance to this CityGML encoding standard must conform to the Requirements Classes contained in this standard.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. The Open Geospatial Consortium shall not be held responsible for identifying any or all such patent rights.

Recipients of this document are requested to submit, with their comments, notification of any relevant patent claims or other intellectual property rights of which they may be aware that might be infringed by any implementation of the standard set forth in this document, and to provide supporting documentation.

iv. Submitting organizations

The following organizations submitted this Document to the Open Geospatial Consortium (OGC):

Chapter 1. Scope

This Standard documents the OGC GML [Implementation Specification](#) (IS) for the CityGML 3.0 Conceptual Model. The CityGML 3.0 conceptual model is a [Platform Independent Model](#) (PIM). It defines concepts in a manner which is independent of any implementing technology. As such, the CityGML CM cannot be implemented directly. Rather, it serves as the base for [Platform Specific Models](#) (PSM). A PSM adds to the PIM the technology-specific details needed to fully define the CityGML model for use with a specific technology. The PSM can then be used to generate the schema and other artifacts needed to build CityGML 3.0 implementations.

This standard defines the PSMs and schemas for the CityGML 3.0 [Implementation Specification](#) (IS) for Geography Markup Language (GML) implemenations.

Chapter 2. Conformance

This standard defines an [Implementation Specification](#) which specifies how the CityGML 3.0 [Conceptual Model](#) should be implemented using Geography Markup Language (GML). The [Standardization Target](#) for this standard is:

1. Implementations of the CityGML 3.0 [Conceptual Model](#) using GML encodings.

2.1. Implementation Specifications

Implementation Specifications define how a Conceptual Model should be implemented using a specific technology. Conformant Implementation Specifications provide evidence that they are an accurate representation of the Conceptual Model. This evidence includes data demonstrating that the applicable criteria documented in the CityGML 3.0 CM Abstract Test Suite have been satisfied. That evidence is provided in [Appendix D](#).

2.2. Conformance Classes

This standard identifies seventeen (17) conformance classes. One conformance class is defined for each GML schema. Each conformance class is defined by one requirements class. The tests in [Annex A](#) are organized by requirements class. So an implementation of the *Core* conformance class must pass all tests specified in Annex A for the *Core* requirements class.

Of these seventeen conformance classes, only the *Core* conformance class is mandatory. All other conformance classes are optional. In the case where a conformance class has a dependency on another conformance class, that conformance class should also be implemented.

Chapter 3. References

The following normative documents contain provisions that, through reference in this text, constitute provisions of OGC TBD. For dated references, subsequent amendments to, or revisions of, any of these publications do not apply. However, parties to agreements based on this part of OGC TBD are encouraged to investigate the possibility of applying the most recent editions of the normative documents indicated below. For undated references, the latest edition of the normative document referred to applies.

Chapter 4. Terms and Definitions

This document uses the terms defined in Sub-clause 5.3 of [OGC 06-121r8], which is based on the ISO/IEC Directives, Part 2, Rules for the structure and drafting of International Standards. In particular, the word “shall” (not “must”) is the verb form used to indicate a requirement to be strictly followed to conform to this Standard.

For the purposes of this document, the following additional terms and definitions apply.

feature

abstraction of real world phenomena

NOTE Features are objects that have an identity that allows for distinguishing features from each other. Features can have spatial and non-spatial properties that describe the features in more detail. Spatial properties are properties that have a geometry from ISO 19107 as data type.

NOTE Features are denoted by the stereotype «FeatureType» in the CityGML 3.0 Conceptual Model.
[ISO 19101-1:2014, 4.1.11]

geometry

an ordered set of n-dimensional points in a given coordinate reference system; can be used to model the spatial extent or shape of a feature

NOTE Geometries are objects that can have an identity that allows for distinguishing geometries from each other. Geometries define the data types of spatial properties of features.

[OGC 15-107, modified]

top-level feature

a feature that represents one of the main components of 3D city models; can be further semantically and spatially decomposed and substructured into parts

NOTE Top-level features are denoted by the stereotype «TopLevelFeatureType» in the CityGML 3.0 Conceptual Model.

[CityGML Conceptual Model]

space

an entity of volumetric extent in the real world

NOTE Spaces can be spatially represented in different LODs and by different types of geometric objects.

NOTE Spaces are represented in the CityGML 3.0 Conceptual Model by those classes that are derived from the class AbstractSpace.

[CityGML Conceptual Model]

space boundary

an entity with areal extent in the real world. Space boundaries are objects that bound a Space. They also realize the contact between adjacent spaces.

NOTE Space boundaries can be spatially represented in different LODs and by different types of geometric objects.

NOTE Space boundaries are represented in the CityGML 3.0 Conceptual Model by those classes that are derived from the class AbstractSpaceBoundary.

[CityGML Conceptual Model]

city-object relation

a specific relation from the city object in which the relation is included to another city object
[CityGML Conceptual Model]

The following definitions were copied from the Conceptual Model specification. We need to decide which of them to keep also in this specification.

2D data

geometry of features is represented in a two-dimensional space

NOTE In other words, the geometry of 2D data is given using (X,Y) coordinates.

[INSPIRE D2.8.III.2, definition 1]

2.5D data

geometry of features is represented in a three-dimensional space with the constraint that, for each (X,Y) position, there is only one Z

[INSPIRE D2.8.III.2, definition 2]

3D data

Geometry of features is represented in a three-dimensional space.

NOTE In other words, the geometry of 2D data is given using (X,Y,Z) coordinates without any constraints.

[INSPIRE D2.8.III.2, definition 3]

application schema

A set of conceptual schema for data required by one or more applications. An application schema contains selected parts of the base schemas presented in the ORM Information Viewpoint. Designers of application schemas may extend or restrict the types defined in the base schemas to define appropriate types for an application domain. Application schemas are information models for a specific information community.

OGC Definitions Register at <http://www.opengis.net/def/glossary/term/ApplicationSchema>

codelist

A value domain including a code for each permissible value.

conceptual model

model that defines concepts of a universe of discourse

[ISO 19101-1:2014, 4.1.5]

conceptual schema

1. formal description of a conceptual model

[ISO 19101-1:2014, 4.1.6]

2. base schema. Formal description of the model of any geospatial information. Application schemas are built from conceptual schemas.

OGC Definitions Register at <http://www.opengis.net/def/glossary/term/ConceptualSchema>

Implementation Specification

Specified on the OGC Document Types Register at <http://www.opengis.net/def/doc-type/is>

levels of detail

quantity of information that portrays the real world

NOTE The concept comprises data capturing rules of spatial object types, the accuracy and the types of geometries, and other aspects of a data specification. In particular, it is related to the notions of scale and resolution.

[INSPIRE Glossary]

life-cycle information

set of properties of a spatial object that describe the temporal characteristics of a version of a spatial object or the changes between versions

[INSPIRE Glossary]

Platform (Model Driven Architecture)

the set of resources on which a system is realized.

[Object Management Group, Model Driven Architecture Guide rev. 2.0]

Platform Independent Model

a model that is independent of a specific platform

[Object Management Group, Model Driven Architecture Guide rev. 2.0]

Platform Specific Model

a model of a system that is defined in terms of a specific platform

[Object Management Group, Model Driven Architecture Guide rev. 2.0]

Chapter 5. Conventions

5.1. Identifiers

The normative provisions in this document are denoted by the URI

<http://www.opengis.net/spec/CityGML-2/3.0>

All requirements and conformance tests that appear in this document are denoted by partial URIs relative to this base.

5.2. UML Notation

This standard is an implementation of the CityGML Conceptual Model (CM) Standard. The CityGML conceptual model was constructed using the Unified Modeling Language (UML). Excerpts from that model appear in this standard. The UML notations used are described in the diagram in [Figure 1](#).

Figure 1. UML notation (see ISO TS 19103, Geographic information - Conceptual schema language).

All associations between model elements in the CityGML Conceptual Model are uni-directional. Thus, associations in the model are navigable in only one direction. The direction of navigation is depicted by an arrowhead. In general, the context an element takes within the association is

indicated by its role. The role is displayed near the target of the association. If the graphical representation is ambiguous though, the position of the role has to be drawn to the element the association points to.

The following stereotypes are used in the model:

- «ApplicationSchema» denotes a conceptual schema for data required by one or more applications. In the CityGML Conceptual Model, every module is defined as a separate application schema to allow for modularization.
- «FeatureType» represents features that are similar and exhibit common characteristics. Features are abstractions of real-world phenomena and have an identity.
- «TopLevelFeatureType» denotes features that represent the main components of the conceptual model. Top-level features may be further semantically and spatially decomposed and substructured into parts.
- «Type» denotes classes that are not directly instantiable, but are used as an abstract collection of operation, attribute and relation signatures. The stereotype is used in the CityGML Conceptual Model only for classes that are imported from the ISO standards 19107, 19109, 19111, and 19123.
- «ObjectType» represents objects that have an identity, but are not features.
- «DataType» defines a set of properties that lack identity. A data type is a classifier with no operations, whose primary purpose is to hold information.
- «Enumeration» enumerates the valid attribute values in a fixed list of named literal values. Enumerations are specified in the CityGML Conceptual Model.
- «BasicType» defines a basic data type.
- «CodeList» enumerates the valid attribute values. In contrast to Enumeration, the list of values is open and, thus, not given inline in the CityGML UML Model. The allowed values can be provided within an external code list.
- «Union» is a list of attributes. The semantics are that only one of the attributes can be present at any time.
- «Property» denotes attributes and association roles. This stereotype does not add further semantics to the conceptual model, but is required to be able to add tagged values to the attributes and association roles that are relevant for the encoding.
- «Version» denotes that the value of an association role that ends at a feature type is a specific version of the feature, not the feature in general.

In order to enhance the readability of the CityGML UML diagrams, classes are depicted in different colors. The following coloring scheme is applied:

Class defined in this
Requirements Class

Classes painted in yellow belong to the Requirements Class which is subject of discussion in that clause of the standard in which the UML diagram is given. For example, in the context of [rc_core_section], which introduces the *CityGML Core* module, the yellow color is used to denote

classes that are defined in the *CityGML Core* Requirements Class. Likewise, the yellow classes shown in the UML diagram in [rc_building-model_section] are associated with the *Building* Requirements Class that is subject of discussion in that chapter.

Class defined in another Requirements Class

Classes painted in blue belong to a Requirements Class different to that associated with the yellow color. In order to explicitly denote to which Requirements Class these classes belong, their class names are preceded by the UML package name of that Requirements Class. For example, in the context of the *Building* Requirements Class, classes from the *CityGML Core* and the *Construction* Requirements Classes are painted in blue and their class names are preceded by *Core* and *Construction*, respectively.

Class defined in ISO 19107, ISO 19111 or ISO 19123

Classes painted in green are defined in the ISO standards 19107, 19111, or 19123. Their class names are preceded by the UML package name, in which the classes are defined.

Class defined in ISO 19109

Classes painted in grey are defined in the ISO standard 19109. In the context of this standard, this only applies to the class *AnyFeature*. *AnyFeature* is an instance of the metaclass *FeatureType* and acts as super class of all classes in the CityGML UML model with the stereotype «*FeatureType*». A metaclass is a class whose instances are classes.

Notes and OCL constraints

The color white is used for notes and Object Constraint Language (OCL) constraints that are provided in the UML diagrams.

The example UML diagram in Figure 2 demonstrates the UML notation and coloring scheme used throughout this standard. In this example, the yellow classes are associated with the *CityGML Building* module, the blue classes are from the *CityGML Core* and *Construction* modules, and the green class depicts a geometry element defined by ISO 19107.

Figure 2. Example UML diagram demonstrating the UML notation and coloring scheme used throughout the CityGML Standard.

5.3. XML Notation

TBD

Chapter 6. Requirements

6.1. Global requirements

6.1.1. Object identifiers for features and geometries

In the GML encoding of the CityGML 3.0 Conceptual Model, different types of objects exist: *features*, *top-level features*, and *geometries*. All these objects have a unique identity, thus, they can be distinguished from each other and can also be referenced from other objects.

The CityGML 3.0 Conceptual Model introduces two attributes to provide all features and toplevel features with a unique identity: 1) the mandatory *featureID* attribute to distinguish all (top-level) features and possible multiple versions of the same real-world object and 2) an optional *identifier* attribute to reference specific (top-level) features independent from their actual feature version. The featureID attribute value is unique within the same CityGML dataset and also for a specific version of a feature, whereas the identifier attribute has an identical value for all versions of the same real-world object. It is recommended to use globally unique identifiers like UUID values or identifiers maintained by an organization such as a mapping agency for both attributes: for the identifier attribute, as these identifiers should remain stable over the lifetime of the real-world object, and for the featureID attribute, as this ensures that 3D city models which are integrated from different sources into e.g. one GIS or database will not have colliding featureID values and also to be able to uniquely identify a specific version of a feature using these identifiers together with a timestamp and a version number.

The two attributes are defined in the UML class *AbstractFeature* as part of the Core module of the CityGML 3.0 Conceptual Model. The class was introduced to the UML model to be able to define attributes at the conceptual level that are automatically inherited from the class *AbstractGML* in the GML encoding, but not in other encodings. In this way, it will be ensured that these attributes are available in all possible CityGML 3.0 encodings. Since these two attributes originate from the GML specification, they are mapped onto the predefined GML concepts *gml:id* and *gml:identifier* in the GML encoding. [Table 4](#) lists the two identity attributes together with their definition and GML encoding, and the GML code in [Listing 1](#) illustrates the use of the identity attributes to represent the object identity in GML instance documents.

Table 4. Identity attributes used in CityGML 3.

UML attributes to provide (top-level) features with identity	Mapping to corresponding GML concepts	Definition
featureID	XML attribute <i>gml:id</i>	Specifies the unique identifier of the feature that is valid in the instance document within which it occurs.
identifier	XML element <i>gml:identifier</i>	Specifies the unique identifier of the feature that is valid globally.

Listing 1. Use of the identity attributes in CityGML 3 instance documents.

```
<bldg:Building gml:id="B1020_t1">
  <gml:identifier codeSpace="www.xyz.org">B1020</gml:identifier>
  <core:creationDate>2012-08-02T00:00:00</core:creationDate>
  <core:terminationDate>2013-10-09T00:00:00</core:terminationDate>
  <bldg:function>Office</bldg:function>
</bldg:Building>
```

The GML encoding implements the geometry model defined in ISO 19107. This means that all geometries are derived from the class AbstractGML as well and, thus, also geometries exhibit the same unique identity as features do. The fact that geometries also have identifiers is of particular importance for CityGML, since CityGML requires defining references to geometries. One example is the application of textures to surfaces. The textures reference the gml:ids of those LinearRings that describe the boundaries of the surface geometries (e.g. Triangle, Polygon, or a MultiSurface consisting of Polygons) to which the textures are applied. Another example is that the CityGML GML encoding allows for realising topological relationships amongst others through referencing of shared geometries.

6.1.2. Referencing features and geometries

There are two XML concepts that are used to reference objects in GML instance documents: the XML Linking Language (XLink) and the XML Pointer Language (XPointer).

XLink allows for creating links to other documents by providing specific attributes that are added to the element that references the document. The most commonly used attribute is *xlink:href*, the value of the attribute is the URI of the referenced document.

In CityGML, however, we are mainly interested in referencing specific objects (features and geometries) within the same or external GML instance document. For this, XPointer is used. To reference objects by their gml:id, a number sign (#) followed by the gml:id of the object to be referenced is added to the URI of the referenced document. In Listing 2, the element *<versionMember>* references a *<Building>* feature. Since the feature is part of the same GML instance document, a relative URI is specified by simply providing the number sign and the gml:id of the building as value of the attribute *xlink:href*. In the context of version management, referencing features by their gml:id means that a specific feature version of a real-world object is referenced.

[Listing 2.](#) Referencing a feature by its `gml:id`.

```
<core:CityModel gml:id="CM_1">
  <core:versionMember>
    <vers:Version gml:id="V_1">
      <vers:versionMember xlink:href="#BU_234"/>
    </vers:Version>
  </core:versionMember>
  <core:cityObjectMember>
    <bldg:Building gml:id="BU_234"> ... </bldg:Building>
  </core:cityObjectMember>
<core:CityModel>
```

When using references, it is important to keep in mind that many (top-level) features in CityGML have a complex structure. This is shown in [Listing 3](#). In general, features can have spatial and non-spatial properties that describe the features in more detail. Spatial properties are properties that have a geometry from ISO 19107 as data type (`<lod2Solid>` in the example). Non-spatial properties can either have a simple data type (`<function>` with Integer value or `<creationDate>` with Date value), but they can also be further specified by additional attributes, such as the height of the building that is described by further properties (`<height>` with the additional properties `<highReference>`, `<lowReference>`, `<status>`, and `<value>`). In addition, they can also be composed of subfeatures that contain spatial and non-spatial properties themselves (`<WallSurface>` with `<lod2MultiSurface>` geometry).

The subfeatures can be provided *inline* or *by reference*. Inline means that the subfeatures are provided directly as content of the (top-level) feature as is shown below, where the subfeature `<BuildingRoom>` is provided as content of the `<Building>` feature. In contrast, by reference means that the subfeatures are provided elsewhere in the CityGML document and are referenced from the (top-level) feature using an XLink as is described above and illustrated in [Listing 2](#).

Listing 3. Complex structure of CityGML features.

```
<bldg:Building gml:id="BU_234">
  <core:creationDate>2019-09-24T00:00:00</core:creationDate>
  <core:boundary>
    <con:WallSurface gml:id="WS_21">
      <core:lod2MultiSurface>
        <gml:MultiSurface gml:id="MS_21_1">
          ...
          </gml:MultiSurface>
        </core:lod2MultiSurface>

    </con:height>
    <bldg:function>1000</bldg:function>
    <bldg:buildingRoom>
      <bldg:BuildingRoom gml:id="BR_3">
        ...
      </bldg:BuildingRoom>
    </bldg:buildingRoom>
  </bldg:Building>
```

6.1.3. Rules for linking features and geometries that are shared by multiple (top-level) features

When modelling cities, geometries and features can be integral parts of multiple city objects. To avoid redundant modelling of these geometries and features, CityGML offers the possibility to represent geometries and features only once and to reference them from any other city object to which they belong as well.

This non-redundant representation guarantees that no integrity problems occur, i.e. several differing instances of the same geometry or feature will not exist.

Three different cases for non-redundant representation need to be differentiated:

1. Geometries are represented in different parts within the same top-level feature. An example is the roof surface of a building. The polygon representing the geometry of the RoofSurface feature is at the same time part of the RoofSurface feature and of the Solid geometry of the Building feature.

2. One geometry can be part of the representation of different features. An example is a road across a bridge, the road surface sharing the geometry with the roof surface of the bridge.
3. One and the same feature can belong to different aggregations. Examples are an intersection that belongs to two roads, the intersection being one and the same feature for both roads, or features that belong to a CityObjectGroup and that are already integral part of the city model.

For these cases, different recommendations are provided for how to encode the references in CityGML.

Although these recommendations impose restrictions, they facilitate at the same time reading, storing, processing, and generating of CityGML documents, because they reduce the multiple possibilities of how to represent and link features and geometries in CityGML documents to the most appropriate ones. Furthermore, top-level features can now completely be loaded in the main memory, because links to shared geometries that are part of different top-level features represented further down in the GML document do not need to be resolved any more. This also facilitates querying features and geometries using web services, as up to now queries cannot address specific parts of a geometry. Maintenance becomes easier as well, because links between feature geometries do not need to be maintained and updated any more when a feature changes its geometry or when the feature does not exist anymore.

Referencing geometries using XLinks within the same and from different top-level features

1. XLinks may be used to reference geometries within the same top-level feature in accordance with rules 1 - 5 in [Section 6.1.3.2](#).
2. XLinks shall not be used to reference geometries from another top-level feature.

Referencing geometries of spaces and space boundaries

1. [The geometry describing a space shall be stored with the space or its space boundaries.]
2. Geometries stored inline a space boundary must be referenced from the geometry of the space using XLinks.
3. Space boundaries shall not reference geometries of the space using XLinks.
4. The geometry of a space may contain the geometries of nested spaces.
5. LoDs must be self-contained: Geometries shall not be shared between different LoDs using XLinks.

Here, XLink represents a link at the geometry level (“geometry link”), i.e. a reference to the ID of the geometry to be reused. The link direction is always from the geometry of the space to the geometries of the space boundaries (example 1).

If the space is not bounded by space boundaries (e.g. WallSurface or RoofSurface), then the geometry is stored as a geometry property (e.g. lod2MultiSurface) of the space. No XLinks are required in this case.

Example 1: Building with Solid geometry and boundary surfaces

Figure 3. Simple building with solid geometry and boundary surfaces.

The building (=space) in Figure 3 is modelled in LOD2 as Solid geometry and is bounded by four WallSurfaces, one RoofSurface, and one GroundSurface (=space boundaries). All space boundaries are modelled as Polygon geometries. The Solid geometry of the building references the Polygon geometries using XLink.

The GML file is available here: https://github.com/opengeospatial/CityGML-3.0Encodings/tree/xlinks-discussion/CityGML/Examples/Building/XLink_examples/1_SimpleBuilding

The Building from the GML file is illustrated in the object diagram in Figure 4. The XLink relations between the Solid geometry and the Polygon geometries are highlighted in red.

Figure 4. UML object diagram for the building in Figure 3.

Example 2: Building with roof overhangs

Figure 5. Building with roof overhangs.

The building (=space) in [Figure 5](#) is modelled in LOD2 as Solid geometry and is bounded by four WallSurfaces, one RoofSurface, and one GroundSurface (=space boundaries). All space boundaries are modelled as Polygon geometries. The Solid geometry of the building references the Polygon geometries using XLink.

The RoofSurface contains four Polygon geometries. Two of these Polygons are roof overhangs (i.e. dangling surfaces), and, thus, are not referenced by the Solid geometry of the building, as they would render the solid invalid if referenced. For this reason, an additional MultiSurface geometry is added to the building that references the dangling surfaces.

The GML file is available here: https://github.com/opengeospatial/CityGML-3.0Encodings/tree/xlinks-discussion/CityGML/Examples/Building/XLink_examples/2_SimpleBuilding_Roof_Overhangs

The Building from the GML file is illustrated in the object diagram in [Figure 6](#). The XLink relations between the Solid geometry and the Polygon geometries are highlighted in red, the XLink relations between the MultiSurface geometry and the dangling surfaces in blue.

Figure 6. UML object diagram for the building in Figure 5.

Example 3: Building with BuildingInstallation

Figure 7. Building with building installation.

The building (=space) in [Figure 7](#) is modelled in LOD2 as Solid geometry and is bounded by eight WallSurfaces, four RoofSurfaces, and one GroundSurface (=space boundaries). In addition, the building has a dormer that is modelled as BuildingInstallation (=space). The building installation is modelled as MultiSurface geometry and is bounded by one RoofSurface and three WallSurfaces (=space boundaries).

The space boundaries of the building and of the building installation are all modelled as Polygon geometries. The Solid geometry of the building references those Polygon geometries that represent the space boundaries of the building space using XLink. The MultiSurface geometry of the building installation references those Polygon geometries that represent the space boundaries of the building installation using XLink. In addition, the Solid geometry may also reference the Polygon geometries that represent the space boundaries of the building installation using XLink.

The GML file is available here: https://github.com/opengeospatial/CityGML-3.0Encodings/tree/xlinks-discussion/CityGML/Examples/Building/XLink_examples/3_Building_With_Nested_Features

The Building from the GML file is illustrated in the object diagram in [Figure 8](#). The XLink relations are highlighted in red.

Figure 8. UML object diagram for the building in Figure 7.

Expressing shared geometries between top-level features using CityObjectRelations

1. If two top-level features share a common geometry, the shared geometry must be stored for each top-level feature separately (follows from 4.1.2).
2. A CityObjectRelation may be modelled for the features where the shared geometries are stored (might be the top-level feature itself or one of its nested features).
3. Each CityObjectRelation must be assigned the relation type “shared”.
4. Each CityObjectRelation must reference the other feature using an XLink. Thus, the reference

shall be bi-directional.

CityObjectRelation represents a link at the feature level (“feature link”) referencing the ID of another feature that contains a shared geometry. The explicit representation of the relation between the features facilitates spatial analyses. For visualisation it would be enough to render only one of the two surfaces (if the viewer is capable of doing so).

Example 1: Two buildings with shared boundary surface

Figure 9. Two buildings with shared boundary surface.

The two buildings (=top-level features) in Figure 9 are modelled in LOD2 as Solid geometry and are bounded by Wall-, Roof-, and GroundSurfaces that are modelled as Polygon geometries. One of the WallSurfaces of the first Building shares the Polygon geometry with one of the WallSurfaces of the second Building. Both WallSurfaces might appear identical, however, the surface normals of the Polygon geometries of the WallSurfaces are pointing in opposite directions.

To express that the WallSurfaces of the two buildings share the Polygon geometry, the WallSurfaces reference each other using a CityObjectRelation with the relation type "shared". Both WallSurfaces contain the Polygon geometry themselves, the second WallSurface, however, in reverse order.

The GML file is available here: https://github.com/opengeospatial/CityGML-3.0Encodings/tree/xlinks-discussion/CityGML/Examples/Building/XLink_examples/4_Cross-Top-Level-XLink

The Buildings from the GML file are illustrated in the object diagram in Figure 10. The CityObjectRelation is highlighted in red.

Figure 10. UML object diagram for the building in Figure 9.

Example 2: Road crossing a Bridge

Figure 11. Shared surfaces between a road and a bridge.

A Road and a Bridge (=top-level features) are modelled in LOD2, as is shown in Figure 11. The Bridge is bounded by Ground-, Roof-, and WallSurfaces that are modelled as MultiSurface geometries. The Road consists of three sections; each section is bounded by two TrafficAreas that are modelled as MultiSurface geometries as well. The RoofSurfaces of the Bridge share MultiSurface geometries with two TrafficAreas of the Road. The RoofSurfaces and the TrafficAreas are geometrically identical, but they differ semantically.

To express that the RoofSurfaces share MultiSurface geometries with two TrafficAreas, they reference each other using CityObjectRelations with the relation type "shared".

The GML file is available here: https://github.com/opengeospatial/CityGML-3.0Encodings/blob/master/CityGML/Examples/Transportation/Basic%20examples/Road_over_Bridge_CityGML3.0_LOD2_with_CityObjectRelations.gml

The Road and Bridge from the GML file are illustrated in the object diagram in Figure 12. The CityObjectRelations are highlighted in red.

Figure 12. UML object diagram for the building in Figure 11.

Example 3: Parking garage

Figure 13. Shared surfaces in a parking garage.

The parking garage in Figure 13 is modelled in LOD2 as a building (=top-level feature) with Floor-, Roof-, and WallSurfaces that are modelled as MultiSurface geometries. The parking garage contains a Road with Sections and TrafficAreas that are modelled as MultiSurface geometries as well. The Floor- and RoofSurface of the Building share MultiSurface geometries with the Sections and TrafficAreas of the Road.

To express the sharing of MultiSurface geometries between the Roof-/WallSurfaces and the Sections/TrafficAreas, they reference each other using CityObjectRelations with the relation type

"shared".

The GML file is available here: https://github.com/opengeospatial/CityGML-3.0Encodings/blob/master/CityGML/Examples/Transportation/Basic%20examples/Road_over_Bridge_CityGML3.0_LOD2_with_CityObjectRelations.gml

Referencing features from alternative aggregations

1. Each feature belongs to a natural aggregation hierarchy and shall be stored inline in this hierarchy.
2. Alternative aggregations may not contain the feature inline but must use an XLink to reference the feature.

Here, XLink represents a link at the feature level ("feature link"), i.e. a reference to the ID of the feature being part of the natural aggregation. All features are part of a natural aggregation, i.e. features are typically represented in a data set once in physical form, either directly as part of the city model when they are top-level features (e.g. a Building), or inline as part of other (top-level) features (e.g. a BuildingRoom represented inline as part of the top-level feature Building). At the same time, the features can also occur in alternative aggregations.

Example 1: Intersection as part of two Roads

Figure 14. Intersection shared by two roads.

In Figure 14, two roads are shown that each have two Sections and one Intersection. The two roads cross each other at the Intersection. Although the Intersection is shared by the Roads, it exists in reality only once. This is reflected by specifying that the natural aggregation of the Intersection feature is Road 2, whereas Road 3 represents an alternative aggregation of the Intersection. Thus, the Intersection feature is represented inline as part of Road 2, whereas it is referenced by Road 3 using an XLink that references the ID of the Intersection feature.

The GML file is available here: https://github.com/opengeospatial/CityGML-3.0Encodings/blob/master/CityGML/Examples/Transportation/Basic%20examples/ParkingGarage_CityGML3.0_LOD2_with_CityObjectRelations_and_XLinks.gml

The two Roads and the Intersection from the GML file are illustrated in the object diagram in Figure 15. The XLink relation is highlighted in red.

Figure 15. UML object diagram for the building in Figure 14.

Example 2: A specific version of a city model

A Version features groups, for instance, versions of city objects that are valid within a specific time period. The city model represents the natural aggregation of these versioned city objects, whereas the Version feature represents the alternative aggregation. Thus, the versioned city objects are represented inline as part of the city model, whereas they are referenced by the Version feature using XLink relations.

Example 3: Building rooms belonging to a Storey

BuildingRooms are usually represented inline as part of the Building they belong to, thus, the Building represents the natural aggregation. In addition, Storeys can group BuildingRooms to indicate which BuildingRoom belongs to which Storey. This grouping represents an alternative aggregation, thus, the Storeys must reference the BuildingRooms using XLink relations.

Example 4: A Building installation spanning across several Building Parts

This example was discussed in issue <https://github.com/opengeospatial/CityGML-3.0CM/issues/8>: “Installations that are spanning across several building parts are to be physically modelled as part of one building part, all other building parts reference the installation using XLinks, expressing in this way, that the installation does not exclusively belong to one building part only.”

This means, that one of the BuildingParts represents the natural aggregation of the BuildingInstallation (i.e. inline representation), whereas the other BuildingParts represent alternative aggregations (i.e. XLink reference).

Example 5: CityObjectGroups

A CityObjectGroup groups existing city objects that are usually represented inline somewhere else in the data set. Thus, CityObjectGroups represent alternative aggregations and have to use XLink to reference the city objects they are grouping.

6.1.4. Encoding of association classes

GML encoding of association classes according to ISO 19136-2

ISO 19136-2 defines an encoding rule for association classes. The encoding rule comprises several steps for deriving a GML encoding from association classes which will be explained in the following based on the UML model provided in [Figure 16](#).

Figure 16. UML object diagram for the building in [Figure 14](#).

The UML model in [Figure 16](#) defines association class X with an association between source class A and target class B. The following steps are defined by the encoding rule, resulting in the UML model shown in [Figure 17](#): - Association class X is converted into intermediate class X. The new intermediate class has the same name, stereotype, tagged values, constraints, attributes, and relationships as the original association class. - The association between source class A and target class B is replaced by two associations, association 1 between the classes A and X, and association 2 between the classes X and B. - The association ends at class X of association 1 and at class B of association 2 receive the role name, navigability, stereotype, and tagged values of the association end at the original target class B. In addition, the association end at class X receives the multiplicity of the association end at the original target class B. The association end at class B receives multiplicity 1. - The association ends at class A of association 1 and at class X of association 2 receive the role name, navigability, stereotype, and tagged values of the association end at the original source class A. In addition, the association end at class X receives the multiplicity of the association end at the original source class A. The association end at class A receives multiplicity 1.

Figure 17. UML model resulting from applying the encoding rule.

The encoding rule can be applied to association classes that are defined with unidirectional, bidirectional or unspecified navigability. Correspondingly, the UML model that results from the encoding rule will also have the associations defined unidirectional, bidirectional or unspecified. The examples here focus on unidirectional associations, since all associations in the CityGML 3.0 Conceptual Model are defined with unidirectional navigability.

Encoding of the tagged value “inlineOrByReference” within association classes

The tagged value “inlineOrByReference” from ISO 19136-1 is commonly used for associations to define how a feature (the so-called referenced feature) that is referenced by another feature (the so-called referencing feature) is to be represented in GML instance documents. Three different values are defined for this tagged value:

- inline: the referenced feature is embedded inside the referencing feature
- byReference: the referenced feature is provided elsewhere in the same or an external GML instance document and is referenced from the referencing feature using XLink
- inlineOrByReference: both representations, i.e. inline and byReference, are possible and, in addition, a mixture of both representations.

When making use of this tagged value in association classes, the encoding rule described above will add this tagged value to the corresponding association ends of association 1 and 2 after having created the intermediate class. [Figure 18](#) and [Figure 19](#) illustrate this. [Figure 18](#) assumes that for the association end at class B the tagged value “inlineOrByReference” is set to the value “inline”. After applying the encoding rule, both the association ends at class X and at class B, will exhibit the value “inline” as is shown in [Figure 19](#). Similarly, when the association in [Figure 18](#) will have the value “byReference” or “inlineOrByReference”, both associations in Figure 4 will exhibit the value “byReference” or “inlineOrByReference”, respectively.

Figure 18. Association class with the tagged value “inlineOrByReference” set to “inline”.

Figure 19. “inlineOrByReference” settings after applying the encoding rule.

Using this tagged value means that three different encodings can be obtained depending on which of the three values is set. These different encodings are illustrated in the following by three different GML instance documents. The source class A, the target class B, and the intermediate class X are represented by corresponding XML elements `<A>`, ``, and `<X>`. The associations between the classes A and X and between X and B are both represented by the property element `<role>`. For illustration purposes, the GML instance documents do not contain root elements and namespaces.

The first GML instance document ([Listing 4](#)) is obtained when setting the tagged value to “inline”.

Here, element X needs to be provided inline element A and element B inline element X.

Listing 4. GML instance document for the value “inline”.

```
<A gml:id="f1">
  <role>
    <X gml:id="f3">
      <role>
        <B gml:id="f2">
        </B>
      </role>
    </X>
  </role>
</A>
```

The second GML instance document ([Listing 5](#)) results from setting the tagged value to “byReference”. Here, element A references element X and element X references element B using XLink.

Listing 5. GML instance document for the value “byReference”.

```
<A gml:id="f1">
  <role xlink:href="#f3"/>
</A>
<X gml:id="f3">
  <role xlink:href="#f2"/>
</X>
<B gml:id="f2">
</B>
```

The third GML instance document ([Listing 6](#)) is obtained when the tagged value is set to “inlineOrByReference”. Here, the inline and byReference representations are combined, i.e. element X is provided inline element A and element B is referenced by element X using XLink. Alternatively, it is also possible that element X is referenced by element A and element B is provided inline element X. In addition, also the GML instances as shown above for “inline” and “byReference” can be represented with the value “inlineOrByReference”.

Listing 6. GML instance document for the value “inlineOrByReference”.

```
<A gml:id="f1">
  <role>
    <X gml:id="f3">
      <role xlink:href="f2"/>
    </X>
  </role>
</A>
<B gml:id="f2">
</B>
```

Restricting the combination of inline and byReference representations in the GML encoding using an Implementation Model

As described above, four different instance representations are possible in the case of the “inlineOrByReference” value. This behaviour is not desired in the GML encoding of the CityGML 3.0 Conceptual Model, as it allows for too many possibilities of how to reference features and, thus, needs to be restricted.

In the CityGML 3.0 Conceptual Model, this setting affects two association classes, *CityObjectRelation* in the Core module and *Role* in the CityObjectGroup module. For both, the only desired way of representing them in GML instance documents is the structure shown in [Listing 6](#). This structure can be specified in a UML model as shown in [Figure 20](#). After converting the association class into an intermediate class, the tagged value of association 1 needs to receive the value “inline” and the tagged value of association 2 the value “byReference”. (Please note: The CityGML 3.0 Conceptual Model also defines the association class *TextureAssociation* in the Appearance module. This association class, however, is not affected here, because it makes use of the value “inline” for which the encoding is correct.)

Figure 20. Desired settings for the value “inlineOrByReference” after applying the encoding rule.

In order to obtain the restricted structure in GML instance documents, an Implementation Model is created prior to the GML encoding of the CityGML 3.0 Conceptual Model. Within the Implementation Model, the association classes are manually converted into intermediate classes and the tagged values of the associations are set as shown in [Figure 20](#). This means that the encoding will directly be performed on the Implementation Model. This solution guarantees for representing references between features according to [Listing 6](#) in GML instance documents and it can be applied directly without any changes to the conversion tools.

In the following, the solution will be exemplified based on the association class *CityObjectRelation*. This association class can be used to specify relationships between different features, e.g. it can be expressed that the WallSurface of one building shares the Polygon geometry with the WallSurface of a second Building. The association class is illustrated in [Figure 21](#), the tagged value is set to "inlineOrByReference".

Figure 21. Association class *CityObjectRelation*.

Within the Implementation Model, this association class is manually converted into an intermediate class and the tagged values of the associations are set as illustrated in [Figure 22](#).

Afterwards, the XML schemas are derived from the Implementation Model.

Figure 22. Association class *CityObjectRelation* represented as intermediate class.

Within a GML instance document, specifying that the WallSurfaces of two buildings share the same geometry is then restricted to the structure as shown in Listing 7. The source and target classes are represented by two XML elements `<WallSurface>` and the intermediate class by the element `<CityObjectRelation>`. The element `WallSurface` of building 1 provides the element `CityObjectRelation` inline, whereas the element `CityObjectRelation` references the `WallSurface` element of building 2 using XLink. In the same way, building 2 provides the element `CityObjectRelation` inline its `WallSurface`, and the `CityObjectRelation` references the `WallSurface` of building 1 using Xlink.

Listing 7. GML instance document for the association class *CityObjectRelation*.

```

<bldg:Building gml:id="bldg_1">
  <boundary>
    <con:WallSurface gml:id="bldg_1_ws_2">
      <relatedTo>
        <CityObjectRelation>
          <relationType>shared</relationType>
          <relatedTo xlink:href="#bldg_2_ws_4"/>
        </CityObjectRelation>
      </relatedTo>
      <lod2MultiSurface> ... </lod2MultiSurface>
    </con:WallSurface>
  </boundary>
</bldg:Building>
<bldg:Building gml:id="bldg_2">
  <boundary>
    <con:WallSurface gml:id="bldg_2_ws_4">
      <relatedTo>
        <CityObjectRelation>
          <relationType>equal</relationType>
          <relatedTo xlink:href="#bldg_1_ws_2"/>
        </CityObjectRelation>
      </relatedTo>
      <lod2MultiSurface> ... </lod2MultiSurface>
    </con:WallSurface>
  </boundary>
</bldg:Building>

```

6.2. Core Conformance Class

The Core Conformance Class implements the following Requirements Classes from the CityGML 3.0 Conceptual Model Standard:

- Core: <http://www.opengis.net/spec/CityGML-1/3.0/req/req-class-core>
- ADE: <http://www.opengis.net/spec/CityGML-1/3.0/req/req-class-ade>

The applicable GML schema is [core.xsd](#).

Requirements Class	
http://www.opengis.net/spec/CityGML-2/3.0/req/req-class-core	
Target type	Implementation
Dependency	core.xsd
Dependency	http://www.opengis.net/spec/CityGML-1/3.0/req/req-class-core
Dependency	http://www.opengis.net/spec/CityGML-1/3.0/req/req-class-ade

6.2.1. GML Elements

The CityGML Core XML elements are listed in the GML schema [core.xsd](#).

6.2.2. Implementation Decisions

The following decisions have been made regarding implementation of the CityGML 3.0 Core conformance class in GML.

1. The UML class AnyFeature is an instance of the metaclass FeatureType which is defined in ISO 19109. AnyFeature is the generalization of all feature types and acts as superclass of all classes in the CityGML UML model with the stereotype «FeatureType». A comparable concept is defined in ISO 19136 with the XML element `gml:AbstractFeature` as the most generic feature in GML and its basic feature model `gml:AbstractFeatureType` from which all feature defined in GML application schemas and, thus, also in the CityGML application schema, are derived. For this reason, the UML class AnyFeature is not encoded as CityGML-specific XML element, but is simply mapped to `gml:AbstractFeature`.
2. The UML class AbstractFeature is the abstract superclass of all feature types within the CityGML Conceptual Model. This class defines amongst others the attributes `featureID`, `identifier`, `name`, and `description`. These attributes represent properties that are predefined in ISO 19136 (i.e. `gml:id`, `gml:identifier`, `gml:name`, and `gml:description`) and are inherited by all features defined in GML application schemas. The attributes were added to the UML model to guarantee that they are available in all possible CityGML encodings. In the GML schema, these attributes are suppressed from being encoded, as they are already inherited by all CityGML features.
3. The UML class ImplicitGeometry is represented as an object type that defines the attribute `objectID`. This attribute was added to the UML model to guarantee that it is available in all possible CityGML encodings. This attribute represents the GML property `gml:id` which all object types automatically inherit in the GML encoding, thus, this attribute is suppressed from being

- encoded.
4. The UML class XALAddress is a placeholder for representing address details according to the OASIS xAL standard. The class is not encoded in the GML schema, but is simply mapped to xAL:Address, the root element for xAL-based address information.
 5. As described in [Section 6.1.4](#), the UML association class CityObjectRelation is modelled as an intermediate class in an Implementation Model before the GML encoding is applied. In this way, a relation between two features A and B can be represented in such a way that feature A provides the element CityObjectRelation inline, whereas the CityObjectRelation references feature B using XLink. This encoding also ensures that the rule on referencing features from alternative aggregations as described in [Section 6.1.3.4](#) is observed.
 6. All associations allow by default that the referenced features can be provided inline or by reference. However, a restriction is defined for the following association, since it represents an alternative aggregation (see rule on referencing features from alternative aggregations in [Section 6.1.3.4](#)):
 - The reflexive association generalizesTo of the element AbstractCityObject; here, a city object must reference its generalized city object using XLink.
 7. An exception to the rule that XLinks shall not be used to reference geometries from another top-level feature (Rule 2 in [Section 6.1.3.1](#)) is defined for the element ImplicitGeometry. The concept of ImplicitGeometry requires that different top-level features can reference the same geometry and appearance; thus, XLinks from different top-level features to the same geometry and appearance are allowed in this case.

6.2.3. Requirements

Requirement 1	/req/core/elements
CityGML XML elements implemented by a conforming instance document shall conform to the GML XML schema in core.xsd .	

6.3. Appearance Conformance Class

The Appearance module supports the modelling of the observable surface properties of CityGML features in the form of textures and material.

Requirements Class	
http://www.opengis.net/spec/CityGML-2/3.0/req/req-class-appearance	
Target type	Implementation
Dependency	appearance.xsd
Dependency	http://www.opengis.net/spec/CityGML-1/3.0/req/req-class-appearance
Dependency	http://www.opengis.net/spec/CityGML-2/3.0/req/req-class-core

The Appearance Conformance Class implements the following Requirements Class from the CityGML 3.0 Conceptual Model Standard:

- Appearance: <http://www.opengis.net/spec/CityGML-1/3.0/req/req-class-appearance>

The applicable GML schema is [appearance.xsd](#).

6.3.1. Dependencies

The Appearance Requirements Class is dependent on the following Requirements Class from this standard:

- The [Core](#) Requirements Class which is the only mandatory Requirements Class. This class contains foundational elements upon which a CityGML dataset is built. The [Core](#) Requirements Class also defines XML elements and types reused by other Requirements Classes.

In addition, the Appearance Requirements Class is dependent on the following external OGC and ISO standards:

- [GML 3.2](#) provides most of the geometry types (e.g., Point, LineString, Polygon) used for spatial representations in this standard. Defines Coordinate Reference Systems. Supports the General Feature Model upon which this standard is based.
- [GML 3.3](#) defines compact encodings of geometry types, linear referencing concepts (e.g., linear element, distance along, Linear Referencing Methods), TINs, and encoding rules for association classes.

6.3.2. Implementation Decisions

The following decisions have been made regarding implementation of the CityGML 3.0 Appearance conformance class in GML.

1. All associations allow by default that the referenced features can be provided inline or by reference. However, a restriction is defined for following association:

- The association class TextureAssociation which connects ParameterizedTexture with AbstractTextureParameterization; here, AbstractTextureParameterization (or rather of the non-abstract subclasses TexCoordList and TexCoordGen) must be represented inline. For the GML encoding this means that the element ParameterizedTexture embeds the element TextureAssociation which, in turn, embeds either the element TexCoordList or TexCoordGen.

6.3.3. Requirements

Requirement 2	/req/appearance/elements
CityGML XML elements implemented by a conforming instance document shall conform to the GML XML schema in appearance.xsd .	

The CityGML Appearance XML elements and their corresponding CityGML UML classes are shown in [Table 4](#). In addition, the CityGML Appearance XML elements are documented in the GML schema [appearance.xsd](#) and in this [HTML documentation](#).

Table 5. Appearance XML Elements

XML Schema Element	Conceptual Model
AbstractSurfaceData	«FeatureType» AbstractSurfaceData
AbstractTexture	«FeatureType» AbstractTexture
Appearance	«FeatureType» Appearance
GeoreferencedTexture	«FeatureType» GeoreferencedTexture
ParameterizedTexture	«FeatureType» ParameterizedTexture
TextureAssociation	«ObjectType» TextureAssociation
X3DMaterial	«FeatureType» X3DMaterial
AbstractTextureParameterization	«DataType» AbstractTextureParameterization
ADEOfAbstractSurfaceData	«DataType» ADEOfAbstractSurfaceData
ADEOfAbstractTexture	«DataType» ADEOfAbstractTexture
ADEOfAppearance	«DataType» ADEOfAppearance
ADEOfGeoreferencedTexture	«DataType» ADEOfGeoreferencedTexture
ADEOfParameterizedTexture	«DataType» ADEOfParameterizedTexture
ADEOfX3DMaterial	«DataType» ADEOfX3DMaterial
TexCoordGen	«DataType» TexCoordGen
TexCoordList	«DataType» TexCoordList

6.4. Bridge Conformance Class

The Bridge module supports representation of thematic and spatial aspects of bridges, bridge parts, bridge installations, and interior bridge structures.

Requirements Class	
http://www.opengis.net/spec/CityGML-2/3.0/req/req-class-bridgee	
Target type	Implementation
Dependency	bridge.xsd
Dependency	http://www.opengis.net/spec/CityGML-1/3.0/req/req-class-bridge
Dependency	http://www.opengis.net/spec/CityGML-2/3.0/req/req-class-core

The Bridge Conformance Class implements the following Requirements Class from the CityGML 3.0 Conceptual Model Standard:

- Bridge: <http://www.opengis.net/spec/CityGML-1/3.0/req/req-class-bridge>

The applicable GML schema is [bridge.xsd](#).

6.4.1. Dependencies

The Appearance Requirements Class is dependent on the following Requirements Class from this standard:

- The [Core](#) Requirements Class which is the only mandatory Requirements Class. This class contains foundational elements upon which a CityGML dataset is built. The [Core](#) Requirements Class also defines XML elements and types reused by other Requirements Classes.

In addition, the Appearance Requirements Class is dependent on the following external OGC and ISO standards:

- [GML 3.2](#) provides most of the geometry types (e.g., Point, LineString, Polygon) used for spatial representations in this standard. Defines Coordinate Reference Systems. Supports the General Feature Model upon which this standard is based.
- [GML 3.3](#) defines compact encodings of geometry types, linear referencing concepts (e.g., linear element, distance along, Linear Referencing Methods), TINs, and encoding rules for association classes.

6.4.2. Implementation Decisions

The following decisions have been made regarding implementation of the CityGML 3.0 Bridge conformance class in GML.

1. All associations allow by default that the referenced features can be provided inline or by reference.

6.4.3. Requirements

Requirement 3	/req/bridge/elements
CityGML XML elements implemented by a conforming instance document shall conform to the GML XML schema in bridge.xsd .	

The CityGML Bridge XML elements are listed in the GML schema [bridge.xsd](#).

6.5. Building Conformance Class

The Building module supports representation of thematic and spatial aspects of buildings, building parts, building installations, building subdivisions, and interior building structures.

Requirements Class	
http://www.opengis.net/spec/CityGML-2/3.0/req/req-class-building	
Target type	Implementation
Dependency	building.xsd
Dependency	http://www.opengis.net/spec/CityGML-1/3.0/req/req-class-building
Dependency	http://www.opengis.net/spec/CityGML-2/3.0/req/req-class-core

The Building Conformance Class implements the following Requirements Class from the CityGML 3.0 Conceptual Model Standard:

- Building: <http://www.opengis.net/spec/CityGML-1/3.0/req/req-class-building>

The applicable GML schema is [building.xsd](#).

6.5.1. Dependencies

The Appearance Requirements Class is dependent on the following Requirements Class from this standard:

- The [Core](#) Requirements Class which is the only mandatory Requirements Class. This class contains foundational elements upon which a CityGML dataset is built. The [Core](#) Requirements Class also defines XML elements and types reused by other Requirements Classes.

In addition, the Appearance Requirements Class is dependent on the following external OGC and ISO standards:

- [GML 3.2](#) provides most of the geometry types (e.g., Point, LineString, Polygon) used for spatial representations in this standard. Defines Coordinate Reference Systems. Supports the General Feature Model upon which this standard is based.
- [GML 3.3](#) defines compact encodings of geometry types, linear referencing concepts (e.g., linear element, distance along, Linear Referencing Methods), TINs, and encoding rules for association classes.

6.5.2. Implementation Decisions

The following decisions have been made regarding implementation of the CityGML 3.0 Building conformance class in GML.

1. All associations allow by default that the referenced features can be provided inline or by reference.

6.5.3. Requirements

Requirement 4	/req/building/elements
CityGML XML elements implemented by a conforming instance document shall conform to the GML XML schema in building.xsd .	

6.6. City Furniture Conformance Class

The CityFurniture module supports representation of city furniture objects. City furniture objects are immovable objects like lanterns, traffic signs, advertising columns, benches, or bus stops that can be found in traffic areas, residential areas, on squares, or in built-up areas.

Requirements Class

<http://www.opengis.net/spec/CityGML-2/3.0/req/req-class-cityfurniture>

Target type	Implementation
Dependency	cityFurniture.xsd
Dependency	http://www.opengis.net/spec/CityGML-1/3.0/req/req-class-cityfurniture
Dependency	http://www.opengis.net/spec/CityGML-2/3.0/req/req-class-core

The City Furniture Conformance Class implements the following Requirements Class from the CityGML 3.0 Conceptual Model Standard:

- CityFurniture: <http://www.opengis.net/spec/CityGML-1/3.0/req/req-class-cityfurniture>

The applicable GML schema is [cityFurniture.xsd](#).

6.6.1. Dependencies

The Appearance Requirements Class is dependent on the following Requirements Class from this standard:

- The [Core](#) Requirements Class which is the only mandatory Requirements Class. This class contains foundational elements upon which a CityGML dataset is built. The [Core](#) Requirements Class also defines XML elements and types reused by other Requirements Classes.

In addition, the Appearance Requirements Class is dependent on the following external OGC and ISO standards:

- [GML 3.2](#) provides most of the geometry types (e.g., Point, LineString, Polygon) used for spatial representations in this standard. Defines Coordinate Reference Systems. Supports the General Feature Model upon which this standard is based.
- [GML 3.3](#) defines compact encodings of geometry types, linear referencing concepts (e.g., linear element, distance along, Linear Referencing Methods), TINs, and encoding rules for association classes.

6.6.2. Implementation Decisions

The following decisions have been made regarding implementation of the CityGML 3.0 City Furniture conformance class in GML.

1. All associations allow by default that the referenced features can be provided inline or by reference.

6.6.3. Requirements

Requirement 5	/req/cityfurniture/elements
CityGML XML elements implemented by a conforming instance document shall conform to the GML XML schema in cityFurniture.xsd .	

The CityGML City Furniture XML elements are listed in the GML schema [cityFurniture.xsd](#).

6.7. City Object Group Conformance Class

The CityObjectGroup module supports grouping of city objects. Arbitrary city objects may be aggregated in groups according to user-defined criteria. A group may be further classified by application-specific attributes.

Requirements Class	
http://www.opengis.net/spec/CityGML-2/3.0/req/req-class-cityobjectgroup	
Target type	Implementation
Dependency	cityObjectGroup.xsd
Dependency	http://www.opengis.net/spec/CityGML-1/3.0/req/req-class-cityobjectgroup
Dependency	http://www.opengis.net/spec/CityGML-2/3.0/req/req-class-core

The City Object Group Conformance Class implements the following Requirements Class from the CityGML 3.0 Conceptual Model Standard:

- CityObjectGroup: <http://www.opengis.net/spec/CityGML-1/3.0/req/req-class-cityobjectgroup>

The applicable GML schema is [cityObjectGroup.xsd](#).

6.7.1. Dependencies

The Appearance Requirements Class is dependent on the following Requirements Class from this standard:

- The [Core](#) Requirements Class which is the only mandatory Requirements Class. This class contains foundational elements upon which a CityGML dataset is built. The [Core](#) Requirements Class also defines XML elements and types reused by other Requirements Classes.

In addition, the Appearance Requirements Class is dependent on the following external OGC and ISO standards:

- [GML 3.2](#) provides most of the geometry types (e.g., Point, LineString, Polygon) used for spatial representations in this standard. Defines Coordinate Reference Systems. Supports the General Feature Model upon which this standard is based.
- [GML 3.3](#) defines compact encodings of geometry types, linear referencing concepts (e.g., linear element, distance along, Linear Referencing Methods), TINs, and encoding rules for association classes.

6.7.2. Implementation Decisions

The following decisions have been made regarding implementation of the CityGML 3.0 City Object Group conformance class in GML.

- As described in [Section 6.1.4](#), the UML association class Role is modelled as an intermediate class in an Implementation Model before the GML encoding is applied. In this way, a relation between a city object group and the features it groups can be represented in such a way that the city object group provides the element Role inline, whereas the Role references the features that belong to the city object group using XLink. This encoding also ensures that the rule on referencing features from alternative aggregations as described in [Section 6.1.3.4](#) is observed.
- All associations allow by default that the referenced features can be provided inline or by reference. However, a restriction is defined for the following association, since it represents an alternative aggregation (see rule on referencing features from alternative aggregations in [Section 6.1.3.4](#)):
 - The association parent which connects CityObjectGroup with AbstractCityObject; here, a city object group must reference its parent city object using XLink.

6.7.3. Requirements

Requirement 6	/req/cityobjectgroup/elements
CityGML XML elements implemented by a conforming instance document shall conform to the GML XML schema in cityObjectGroup.xsd .	

The CityGML City Object Group XML elements are listed in the GML schema [cityObjectGroup.xsd](#).

6.8. Construction Conformance Class

The Construction module supports representation of key elements of different types of constructions. These key elements include construction surfaces (e.g floor and ceiling), windows and doors, constructive elements (e.g. beams and slabs), installations, and furniture.

Requirements Class	
http://www.opengis.net/spec/CityGML-2/3.0/req/req-class-construction	
Target type	Implementation
Dependency	construction.xsd
Dependency	http://www.opengis.net/spec/CityGML-1/3.0/req/req-class-construction
Dependency	http://www.opengis.net/spec/CityGML-2/3.0/req/req-class-core

The Construction Conformance Class implements the following Requirements Class from the CityGML 3.0 Conceptual Model Standard:

- Construction: <http://www.opengis.net/spec/CityGML-1/3.0/req/req-class-construction>

The applicable GML schema is [construction.xsd](#).

6.8.1. Dependencies

The Appearance Requirements Class is dependent on the following Requirements Class from this standard:

- The [Core Requirements Class](#) which is the only mandatory Requirements Class. This class contains foundational elements upon which a CityGML dataset is built. The [Core Requirements Class](#) also defines XML elements and types reused by other Requirements Classes.

In addition, the Appearance Requirements Class is dependent on the following external OGC and ISO standards:

- [GML 3.2](#) provides most of the geometry types (e.g., Point, LineString, Polygon) used for spatial representations in this standard. Defines Coordinate Reference Systems. Supports the General Feature Model upon which this standard is based.
- [GML 3.3](#) defines compact encodings of geometry types, linear referencing concepts (e.g., linear element, distance along, Linear Referencing Methods), TINs, and encoding rules for association classes.

6.8.2. Implementation Decisions

The following decisions have been made regarding implementation of the CityGML 3.0 Construction conformance class in GML.

1. All associations allow by default that the referenced features can be provided inline or by reference.

6.8.3. Requirements

Requirement 7	/req/construction/elements
----------------------	--

CityGML XML elements implemented by a conforming instance document shall conform to the GML XML schema in [construction.xsd](#).

The CityGML Construction XML elements are listed in the GML schema [construction.xsd](#).

6.9. Dynamizer Conformance Class

The Dynamizer module supports the injection of timeseries data for individual attributes of CityGML features. Timeseries data can either be retrieved from external Sensor APIs (e.g. OGC SensorThings API, OGC Sensor Observation Services, MQTT, proprietary platforms), external standardized timeseries files (e.g. OGC TimeseriesML or OGC Observations & Measurements), external tabulated files (e.g CSV) or can be represented inline as basic time- value pairs.

Requirements Class	
---------------------------	--

<http://www.opengis.net/spec/CityGML-2/3.0/req/req-class-dynamizer>

Target type	Implementation
Dependency	dynamizer.xsd
Dependency	http://www.opengis.net/spec/CityGML-1/3.0/req/req-class-dynamizer
Dependency	http://www.opengis.net/spec/CityGML-2/3.0/req/req-class-core

The Dynamizer Conformance Class implements the following Requirements Class from the CityGML

3.0 Conceptual Model Standard:

- Dynamizer: <http://www.opengis.net/spec/CityGML-1/3.0/req/req-class-dynamizer>

The applicable GML schema is [dynamizer.xsd](#).

6.9.1. Dependencies

The Appearance Requirements Class is dependent on the following Requirements Class from this standard:

- The [Core](#) Requirements Class which is the only mandatory Requirements Class. This class contains foundational elements upon which a CityGML dataset is built. The [Core](#) Requirements Class also defines XML elements and types reused by other Requirements Classes.

In addition, the Appearance Requirements Class is dependent on the following external OGC and ISO standards:

- [GML 3.2](#) provides most of the geometry types (e.g., Point, LineString, Polygon) used for spatial representations in this standard. Defines Coordinate Reference Systems. Supports the General Feature Model upon which this standard is based.
- [GML 3.3](#) defines compact encodings of geometry types, linear referencing concepts (e.g., linear element, distance along, Linear Referencing Methods), TINs, and encoding rules for association classes.

6.9.2. Implementation Decisions

The following decisions have been made regarding implementation of the CityGML 3.0 Dynamizer conformance class in GML.

1. All associations allow by default that the referenced features can be provided inline or by reference. However, a restriction is defined for the following association, since it represents an alternative aggregation (see rule on referencing features from alternative aggregations in [Section 6.1.3.4](#)):
 - The association sensorLocation which connects SensorConnection with AbstractCityObject; here, a sensor connection must reference the city object for which it provides sensor information using XLink.
2. The PointCloud module allows for representing the geometries of city objects by 3D point clouds in three ways. Examples for each representation option are provided in [Section B.1](#):
 - A MultiPoint geometry is provided inline with the CityGML file, i.e. the point cloud of a specific feature is embedded directly within the feature represented by the point cloud.
 - A separate point cloud file is provided for every feature. Each feature in the CityGML file references the corresponding point cloud file.
 - One point cloud file is provided that contains all points from all features in a specific area. In the point cloud file, all points belonging to a specific feature have the same value set in the attribute "point_source_id". Each feature in the CityGML instance document references the point cloud file and all points with the corresponding value in the attribute

"point_source_id".

6.9.3. Requirements

Requirement 8	/req/dynamizer/elements
CityGML XML elements implemented by a conforming instance document shall conform to the GML XML schema in dynamizer.xsd .	

The CityGML Dynamizer XML elements are listed in the GML schema [dynamizer.xsd](#).

6.10. Generics Conformance Class

The Generics module supports application-specific extensions to the CityGML conceptual model. These extensions may be used to model and exchange additional attributes and features not covered by the predefined thematic classes of CityGML. Generic extensions shall only be used if appropriate thematic classes or attributes are not provided by any other City GML module.

The Generics Conformance Class implements the following Requirements Class from the CityGML 3.0 Conceptual Model Standard:

Requirements Class	
http://www.opengis.net/spec/CityGML-2/3.0/req/req-class-generics	
Target type	Implementation
Dependency	generics.xsd
Dependency	http://www.opengis.net/spec/CityGML-1/3.0/req/req-class-generics
Dependency	http://www.opengis.net/spec/CityGML-2/3.0/req/req-class-core

- Generics: <http://www.opengis.net/spec/CityGML-1/3.0/req/req-class-generics>

The applicable GML schema is [generics.xsd](#).

6.10.1. Dependencies

The Appearance Requirements Class is dependent on the following Requirements Class from this standard:

- The [Core](#) Requirements Class which is the only mandatory Requirements Class. This class contains foundational elements upon which a CityGML dataset is built. The [Core](#) Requirements Class also defines XML elements and types reused by other Requirements Classes.

In addition, the Appearance Requirements Class is dependent on the following external OGC and ISO standards:

- [GML 3.2](#) provides most of the geometry types (e.g., Point, LineString, Polygon) used for spatial representations in this standard. Defines Coordinate Reference Systems. Supports the General Feature Model upon which this standard is based.

- GML 3.3 defines compact encodings of geometry types, linear referencing concepts (e.g., linear element, distance along, Linear Referencing Methods), TINs, and encoding rules for association classes.

6.10.2. Implementation Decisions

The following decisions have been made regarding implementation of the CityGML 3.0 Generics conformance class in GML.

1. All associations allow by default that the referenced features can be provided inline or by reference.

6.10.3. Requirements

Requirement 9	/req/generics/elements
CityGML XML elements implemented by a conforming instance document shall conform to the GML XML schema in generics.xsd .	

The CityGML Generics XML elements are listed in the GML schema [generics.xsd](#).

6.11. Land Use Conformance Class

The LandUse module supports representation of areas of the earth's surface dedicated to a specific land use.

Requirements Class	
http://www.opengis.net/spec/CityGML-2/3.0/req/req-class-landuse	
Target type	Implementation
Dependency	landUse.xsd
Dependency	http://www.opengis.net/spec/CityGML-1/3.0/req/req-class-landuse
Dependency	http://www.opengis.net/spec/CityGML-2/3.0/req/req-class-core

The Land Use Conformance Class implements the following Requirements Class from the CityGML 3.0 Conceptual Model Standard:

- LandUse: <http://www.opengis.net/spec/CityGML-1/3.0/req/req-class-landuse>

The applicable GML schema is [landUse.xsd](#).

6.11.1. Dependencies

The Appearance Requirements Class is dependent on the following Requirements Class from this standard:

- The [Core](#) Requirements Class which is the only mandatory Requirements Class. This class contains foundational elements upon which a CityGML dataset is built. The [Core](#) Requirements

Class also defines XML elements and types reused by other Requirements Classes.

In addition, the Appearance Requirements Class is dependent on the following external OGC and ISO standards:

- [GML 3.2](#) provides most of the geometry types (e.g., Point, LineString, Polygon) used for spatial representations in this standard. Defines Coordinate Reference Systems. Supports the General Feature Model upon which this standard is based.
- [GML 3.3](#) defines compact encodings of geometry types, linear referencing concepts (e.g., linear element, distance along, Linear Referencing Methods), TINs, and encoding rules for association classes.

6.11.2. Implementation Decisions

The following decisions have been made regarding implementation of the CityGML 3.0 Land Use conformance class in GML.

1. All associations allow by default that the referenced features can be provided inline or by reference.

6.11.3. Requirements

Requirement 10	/req/landuse/elements
CityGML XML elements implemented by a conforming instance document shall conform to the GML XML schema in landUse.xsd .	

The CityGML Land Use XML elements are listed in the GML schema [landUse.xsd](#).

6.12. Point Cloud Conformance Class

ThePointCloud module supports representation of CityGML features by a collection of points.

Requirements Class	
http://www.opengis.net/spec/CityGML-2/3.0/req/req-class-pointcloud	
Target type	Implementation
Dependency	pointCloud.xsd
Dependency	http://www.opengis.net/spec/CityGML-1/3.0/req/req-class-pointcloud
Dependency	http://www.opengis.net/spec/CityGML-2/3.0/req/req-class-core

The Point Cloud Conformance Class implements the following Requirements Class from the CityGML 3.0 Conceptual Model Standard:

- Point Cloud: <http://www.opengis.net/spec/CityGML-1/3.0/req/req-class-pointcloud>

The applicable GML schema is [pointCloud.xsd](#).

6.12.1. Dependencies

The Appearance Requirements Class is dependent on the following Requirements Class from this standard:

- The [Core](#) Requirements Class which is the only mandatory Requirements Class. This class contains foundational elements upon which a CityGML dataset is built. The [Core](#) Requirements Class also defines XML elements and types reused by other Requirements Classes.

In addition, the Appearance Requirements Class is dependent on the following external OGC and ISO standards:

- [GML 3.2](#) provides most of the geometry types (e.g., Point, LineString, Polygon) used for spatial representations in this standard. Defines Coordinate Reference Systems. Supports the General Feature Model upon which this standard is based.
- [GML 3.3](#) defines compact encodings of geometry types, linear referencing concepts (e.g., linear element, distance along, Linear Referencing Methods), TINs, and encoding rules for association classes.

6.12.2. Implementation Decisions

The following decisions have been made regarding implementation of the CityGML 3.0 Point Cloud conformance class in GML.

1. All associations allow by default that the referenced features can be provided inline or by reference.

6.12.3. Requirements

Requirement 11	/req/pointcloud/elements
CityGML XML elements implemented by a conforming instance document shall conform to the GML XML schema in pointCloud.xsd .	

The CityGML Point Cloud XML elements are listed in the GML schema [pointCloud.xsd](#).

6.13. Relief Conformance Class

The Relief module supports representation of the terrain. CityGML supports terrain representations at different levels of detail, reflecting different accuracies or resolutions. Terrain may be specified as a regular raster or grid, as a TIN, by break lines, and/or by mass points.

Requirements Class	
http://www.opengis.net/spec/CityGML-2/3.0/req/req-class-relief	
Target type	Implementation
Dependency	relief.xsd
Dependency	http://www.opengis.net/spec/CityGML-1/3.0/req/req-class-relief

Dependency	http://www.opengis.net/spec/CityGML-2/3.0/req/req-class-core
------------	---

The Relief Conformance Class implements the following Requirements Class from the CityGML 3.0 Conceptual Model Standard:

- Relief: <http://www.opengis.net/spec/CityGML-1/3.0/req/req-class-relief>

The applicable GML schema is [relief.xsd](#).

6.13.1. Dependencies

The Appearance Requirements Class is dependent on the following Requirements Class from this standard:

- The [Core](#) Requirements Class which is the only mandatory Requirements Class. This class contains foundational elements upon which a CityGML dataset is built. The [Core](#) Requirements Class also defines XML elements and types reused by other Requirements Classes.

In addition, the Appearance Requirements Class is dependent on the following external OGC and ISO standards:

- [GML 3.2](#) provides most of the geometry types (e.g., Point, LineString, Polygon) used for spatial representations in this standard. Defines Coordinate Reference Systems. Supports the General Feature Model upon which this standard is based.
- [GML 3.3](#) defines compact encodings of geometry types, linear referencing concepts (e.g., linear element, distance along, Linear Referencing Methods), TINs, and encoding rules for association classes.

6.13.2. Implementation Decisions

The following decisions have been made regarding implementation of the CityGML 3.0 Relief conformance class in GML.

1. All associations allow by default that the referenced features can be provided inline or by reference.

6.13.3. Requirements

Requirement 12	/req/relief/elements
----------------	----------------------

CityGML XML elements implemented by a conforming instance document shall conform to the GML XML schema in [relief.xsd](#).

The CityGML Relief XML elements are listed in the GML schema [relief.xsd](#).

6.14. Transportation Conformance Class

The Transportation module supports representation of the transportation infrastructure. Transportation features include roads, tracks, waterways, railways, and squares. Transportation

features may be represented as a network and/or as a collection of spaces or surface elements embedded in a three-dimensional space.

Requirements Class	
http://www.opengis.net/spec/CityGML-2/3.0/req/req-class-transportation	
Target type	Implementation
Dependency	transportation.xsd
Dependency	http://www.opengis.net/spec/CityGML-1/3.0/req/req-class-transportation
Dependency	http://www.opengis.net/spec/CityGML-2/3.0/req/req-class-core

The Transportation Conformance Class implements the following Requirements Class from the CityGML 3.0 Conceptual Model Standard:

- Transportation: <http://www.opengis.net/spec/CityGML-1/3.0/req/req-class-transportation>

The applicable GML schema is [transportation.xsd](#).

6.14.1. Dependencies

The Appearance Requirements Class is dependent on the following Requirements Class from this standard:

- The [Core](#) Requirements Class which is the only mandatory Requirements Class. This class contains foundational elements upon which a CityGML dataset is built. The [Core](#) Requirements Class also defines XML elements and types reused by other Requirements Classes.

In addition, the Appearance Requirements Class is dependent on the following external OGC and ISO standards:

- [GML 3.2](#) provides most of the geometry types (e.g., Point, LineString, Polygon) used for spatial representations in this standard. Defines Coordinate Reference Systems. Supports the General Feature Model upon which this standard is based.
- [GML 3.3](#) defines compact encodings of geometry types, linear referencing concepts (e.g., linear element, distance along, Linear Referencing Methods), TINs, and encoding rules for association classes.

6.14.2. Implementation Decisions

The following decisions have been made regarding implementation of the CityGML 3.0 Transportation conformance class in GML.

1. All associations allow by default that the referenced features can be provided inline or by reference. However, restrictions are defined for the following associations, since they represent alternative aggregations (see rule on referencing features from alternative aggregations in [Section 6.1.3.4](#)):
 - The reflexive association successor of TrafficSpace; here, a traffic space must reference its

succeeding traffic space using XLink.

- The reflexive association predecessor of TrafficSpace; here, a traffic space must reference its preceding traffic space using XLink.

6.14.3. Requirements

Requirement 13	/req/transportation/elements
CityGML XML elements implemented by a conforming instance document shall conform to the GML XML schema in transportation.xsd .	

The CityGML Transportation XML elements are listed in the GML schema [transportation.xsd](#).

6.15. Tunnel Conformance Class

The Tunnel module supports representation of thematic and spatial aspects of tunnels, tunnel parts, tunnel installations, and interior tunnel structures.

Requirements Class	
http://www.opengis.net/spec/CityGML-2/3.0/req/req-class-tunnel	
Target type	Implementation
Dependency	tunnel.xsd
Dependency	http://www.opengis.net/spec/CityGML-1/3.0/req/req-class-tunnel
Dependency	http://www.opengis.net/spec/CityGML-2/3.0/req/req-class-core

The Tunnel Conformance Class implements the following Requirements Class from the CityGML 3.0 Conceptual Model Standard:

- Tunnel: <http://www.opengis.net/spec/CityGML-1/3.0/req/req-class-tunnel>

The applicable GML schema is [tunnel.xsd](#).

6.15.1. Dependencies

The Appearance Requirements Class is dependent on the following Requirements Class from this standard:

- The [Core](#) Requirements Class which is the only mandatory Requirements Class. This class contains foundational elements upon which a CityGML dataset is built. The [Core](#) Requirements Class also defines XML elements and types reused by other Requirements Classes.

In addition, the Appearance Requirements Class is dependent on the following external OGC and ISO standards:

- [GML 3.2](#) provides most of the geometry types (e.g., Point, LineString, Polygon) used for spatial representations in this standard. Defines Coordinate Reference Systems. Supports the General Feature Model upon which this standard is based.

- GML 3.3 defines compact encodings of geometry types, linear referencing concepts (e.g., linear element, distance along, Linear Referencing Methods), TINs, and encoding rules for association classes.

6.15.2. Implementation Decisions

The following decisions have been made regarding implementation of the CityGML 3.0 Tunnel conformance class in GML.

1. All associations allow by default that the referenced features can be provided inline or by reference.

6.15.3. Requirements

Requirement 14	/req/tunnel/elements
CityGML XML elements implemented by a conforming instance document shall conform to the GML XML schema in tunnel.xsd .	

The CityGML Tunnel XML elements are listed in the GML schema [tunnel.xsd](#).

6.16. Vegetation Conformance Class

The Vegetation module supports representation of vegetation objects with vegetation- specific thematic classes. CityGML's vegetation model distinguishes between solitary vegetation objects like trees, and vegetation areas which represent biotopes like forests or other plant communities.

Requirements Class	
http://www.opengis.net/spec/CityGML-2/3.0/req/req-class-vegetation	
Target type	Implementation
Dependency	vegetation.xsd
Dependency	http://www.opengis.net/spec/CityGML-1/3.0/req/req-class-vegetation
Dependency	http://www.opengis.net/spec/CityGML-2/3.0/req/req-class-core

The Vegetation Conformance Class implements the following Requirements Class from the CityGML 3.0 Conceptual Model Standard:

- Vegetation: <http://www.opengis.net/spec/CityGML-1/3.0/req/req-class-vegetation>

The applicable GML schema is [vegetation.xsd](#).

6.16.1. Dependencies

The Appearance Requirements Class is dependent on the following Requirements Class from this standard:

- The [Core](#) Requirements Class which is the only mandatory Requirements Class. This class

contains foundational elements upon which a CityGML dataset is built. The [Core Requirements Class](#) also defines XML elements and types reused by other Requirements Classes.

In addition, the Appearance Requirements Class is dependent on the following external OGC and ISO standards:

- [GML 3.2](#) provides most of the geometry types (e.g., Point, LineString, Polygon) used for spatial representations in this standard. Defines Coordinate Reference Systems. Supports the General Feature Model upon which this standard is based.
- [GML 3.3](#) defines compact encodings of geometry types, linear referencing concepts (e.g., linear element, distance along, Linear Referencing Methods), TINs, and encoding rules for association classes.

6.16.2. Implementation Decisions

The following decisions have been made regarding implementation of the CityGML 3.0 Vegetation conformance class in GML.

1. All associations allow by default that the referenced features can be provided inline or by reference.

6.16.3. Requirements

Requirement 15	/req/vegetation/elements
CityGML XML elements implemented by a conforming instance document shall conform to the GML XML schema in vegetation.xsd .	

The CityGML Vegetation XML elements are listed in the GML schema [vegetation.xsd](#).

6.17. Versioning Conformance Class

The Versioning module supports representation of multiple versions of CityGML features within a single CityGML model. In addition, also the version transitions and transactions that lead to the different versions can be represented.

Requirements Class	
http://www.opengis.net/spec/CityGML-2/3.0/req/req-class-versioning	
Target type	Implementation
Dependency	versioning.xsd
Dependency	http://www.opengis.net/spec/CityGML-1/3.0/req/req-class-versioning
Dependency	http://www.opengis.net/spec/CityGML-2/3.0/req/req-class-core

The Versioning Conformance Class implements the following Requirements Class from the CityGML 3.0 Conceptual Model Standard:

- Versioning: <http://www.opengis.net/spec/CityGML-1/3.0/req/req-class-versioning>

The applicable GML schema is [versioning.xsd](#).

6.17.1. Dependencies

The Appearance Requirements Class is dependent on the following Requirements Class from this standard:

- The [Core](#) Requirements Class which is the only mandatory Requirements Class. This class contains foundational elements upon which a CityGML dataset is built. The [Core](#) Requirements Class also defines XML elements and types reused by other Requirements Classes.

In addition, the Appearance Requirements Class is dependent on the following external OGC and ISO standards:

- [GML 3.2](#) provides most of the geometry types (e.g., Point, LineString, Polygon) used for spatial representations in this standard. Defines Coordinate Reference Systems. Supports the General Feature Model upon which this standard is based.
- [GML 3.3](#) defines compact encodings of geometry types, linear referencing concepts (e.g., linear element, distance along, Linear Referencing Methods), TINs, and encoding rules for association classes.

6.17.2. Implementation Decisions

The following decisions have been made regarding implementation of the CityGML 3.0 Versioning conformance class in GML.

1. All associations allow by default that the referenced features can be provided inline or by reference. However, restrictions are defined for the following associations, since they represent alternative aggregations (see rule on referencing features from alternative aggregations in [Section 6.1.3.4](#)):
 - The association oldFeature which connects Transaction with AbstractFeatureWithLifespan; here, a transaction must reference the version of the city object prior to the transaction using XLink.
 - The association newFeature which connects Transaction with AbstractFeatureWithLifespan; here, a transaction must reference the version of the city object subsequent to the transaction using XLink.
 - The association from which connects VersionTransition with Version; here, a version transition must reference the predecessor version of the VersionTransition using XLink.
 - The association to which connects VersionTransition with Version; here, a version transition must reference the successor version of the VersionTransition using XLink.
 - The association versionMember which connects Version with AbstractFeatureWithLifespan; here, a version must reference the features that are part of this version using XLink.

6.17.3. Requirements

Requirement 16	/req/versioning/elements
----------------	--------------------------

CityGML XML elements implemented by a conforming instance document shall conform to the GML XML schema in [versioning.xsd](#).

The CityGML Versioning XML elements are listed in the GML schema [versioning.xsd](#).

6.18. Water Body Conformance Class

The WaterBody module supports representation of the thematic aspects and 3D geometry of rivers, canals, lakes, and basins. It does, however, not inherit any hydrological or other dynamic aspects of fluid flow.

Requirements Class

<http://www.opengis.net/spec/CityGML-2/3.0/req/req-class-waterbody>

Target type	Implementation
Dependency	waterBody.xsd
Dependency	http://www.opengis.net/spec/CityGML-1/3.0/req/req-class-waterbody
Dependency	http://www.opengis.net/spec/CityGML-2/3.0/req/req-class-core

The Water Body Conformance Class implements the following Requirements Class from the CityGML 3.0 Conceptual Model Standard:

- WaterBody: <http://www.opengis.net/spec/CityGML-1/3.0/req/req-class-waterbody>

The applicable GML schema is [waterBody.xsd](#).

6.18.1. Dependencies

The Appearance Requirements Class is dependent on the following Requirements Class from this standard:

- The [Core](#) Requirements Class which is the only mandatory Requirements Class. This class contains foundational elements upon which a CityGML dataset is built. The [Core](#) Requirements Class also defines XML elements and types reused by other Requirements Classes.

In addition, the Appearance Requirements Class is dependent on the following external OGC and ISO standards:

- [GML 3.2](#) provides most of the geometry types (e.g., Point, LineString, Polygon) used for spatial representations in this standard. Defines Coordinate Reference Systems. Supports the General Feature Model upon which this standard is based.
- [GML 3.3](#) defines compact encodings of geometry types, linear referencing concepts (e.g., linear element, distance along, Linear Referencing Methods), TINs, and encoding rules for association classes.

6.18.2. Implementation Decisions

The following decisions have been made regarding implementation of the CityGML 3.0 Water Body conformance class in GML.

1. All associations allow by default that the referenced features can be provided inline or by reference.

6.18.3. Requirements

Requirement 17	/req/waterbody/elements
-----------------------	-------------------------

CityGML XML elements implemented by a conforming instance document shall conform to the GML XML schema in [waterBody.xsd](#).

The CityGML Water Body XML elements are listed in the GML schema [waterBody.xsd](#).

Chapter 7. Media Types

Data for all Parts of the CityGML 3.0 GML encoding standard is encoded in GML-conformant XML documents. The standard MIME-type and sub-type for GML data should be used to indicate the encoding in internet exchange.

The registered MIME Media Type for GML documents is [application/gml+xml](#).

Annex A: Conformance Class Abstract Test Suite (Normative)

NOTE

Ensure that there is a conformance class for each requirements class and a test for each requirement (identified by requirement name and number)

A.1. Conformance Class A

A.1.1. Requirement 1

Test id:	/conf/conf-class-a/req-name-1
Requirement:	/req/req-class-a/req-name-1
Test purpose:	Verify that...
Test method:	Inspect...

A.1.2. Requirement 2

Annex B: Examples (Informative)

NOTE

This is where any examples will live. For ease of maintenance, each example should be created in its' own asccidoc file and then imported using an "include" statement.

B.1. Examples for the Dynamizer module (Informative)

The PointCloud module allows for representing the geometries of city objects by 3D point clouds in three ways. The complete CityGML and LAZ files are available [here](#).

Inline representation

A MultiPoint geometry is provided inline with the CityGML file, i.e. the point cloud of a specific feature is embedded directly within the feature represented by the point cloud. [Listing 8](#) shows an example for a point cloud of a building reprented inline the Building feature.

Listing 8. The point cloud of a building is embedded in the Building feature.

```
<?xml version="1.0" encoding="UTF-8"?>
<core:CityModel ... Namespaces and Schema location ... >
    <core:cityObjectMember>
        <bldg:Building gml:id="DEBY_LOD2_4903217">
            <gml:name>DEBY_LOD2_4903217</gml:name>
            <core:creationDate>2015-09-24T00:00:00</core:creationDate>
            <core:boundary> ... </core:boundary>
            ...
            <core:pointCloud>
                <pcl:PointCloud gml:id="93648526a0d3">
                    <pcl:points>
                        <gml:MultiPoint gml:id="93648526a0d3-0"

                                    <gml:pos>4467309 5331553 539.66</gml:pos>
                                </gml:Point>
                            </gml:pointMember>
                            ...
                            ... further points ...
                        </gml:MultiPoint>
                    </pcl:points>
                </pcl:PointCloud>
            </core:pointCloud>
            <con:height>
                <con:Height>
                    <con:highReference>topOfConstruction</con:highReference>
                    <con:lowReference>lowestGroundPoint</con:lowReference>
                    <con:status>measured</con:status>
                    <con:value uom="urn:adv:uom:m">24.709</con:value>
                </con:Height>
            </con:height>
            <bldg:function>99999_1001</bldg:function>
            <bldg:roofType>3100</bldg:roofType>
        </bldg:Building>
    </core:cityObjectMember>
</core:CityModel>
```

Figure 23 shows different visualisations of the GML file. The left image displays the building features themselves, the middle image shows the point clouds of the buildings, and the right image is a combination of the building features and the point clouds.

Figure 23. Visualization of the inline representation of points clouds.

External representation in multiple files

A separate point cloud file is provided for every feature. Each feature in the CityGML file references the corresponding point cloud file. This is shown in Listing 9, where the building feature references the LAZ file DEBY_LOD2_4903217.laz that contains the points for this building (illustrated in Figure 24).

Listing 9. The point cloud of a building is referenced in an external file.

```
<?xml version="1.0" encoding="UTF-8"?>
<core:CityModel ... Namespaces and Schema location ... >
    <core:cityObjectMember>
        <bldg:Building gml:id="DEBY_LOD2_4903217">
            <gml:name>DEBY_LOD2_4903217</gml:name>
            <core:creationDate>2015-09-24T00:00:00</core:creationDate>
            <core:boundary> ... </core:boundary>
            ...
            <core:pointCloud>
                <pcl:PointCloud gml:id="DEBY_LOD2_4903217_c0e8322c-8cf4-4fdd-8ddc-4780566814a5">
                    <pcl:pointFile>..\pointcloud\DEBY_LOD2_4903217.laz</pcl:pointFile>
                    </pcl:PointCloud>
                </core:pointCloud>
                <con:height>
                    <con:Height>
                        <con:highReference>topOfConstruction</con:highReference>
                        <con:lowReference>lowestGroundPoint</con:lowReference>
                        <con:status>measured</con:status>
                        <con:value uom="urn:adv:uom:m">24.709</con:value>
                    </con:Height>
                </con:height>
                <bldg:function>99999_1001</bldg:function>
                <bldg:roofType>3100</bldg:roofType>
            </bldg:Building>
        </core:cityObjectMember>
    </core:CityModel>
```

Figure 24. Visualization of the externally referenced LAZ file containing the point cloud of one building.

External representation in a single file

One point cloud file is provided that contains all points from all features in a specific area. In the point cloud file, all points belonging to a specific feature have the same value set in the attribute "point_source_id". Each feature in the CityGML instance document references the point cloud file and all points with the corresponding value in the attribute "point_source_id". In [Listing 10](#), the building feature references all points with the point_source_id value 132 in the LAZ file 4467_5331_40_bDOM_classified.laz. The LAZ file itself is shown in [Figure 25](#). Highlighted are those points with the point_source_id value 132.

Listing 10. The point cloud of a building is referenced in an external file.

Annex C: XML Schema (Normative)

NOTE

This is where any XML or JSON schema reside. Conformance is defined, in part, by conformance to these schemas.

C.1. Core module

The CityGML Core module is defined in the XML Schema Definition file *core.xsd* ([Listing 11](#)). The target namespace <http://www.opengis.net/citygml/3.0> is associated with this module.

Listing 11. core.xsd

```
<?xml version="1.0" encoding="UTF-8"?><schema xmlns="http://www.w3.org/2001/XMLSchema"
      xmlns:core="http://www.opengis.net/citygml/3.0"
      xmlns:gml="http://www.opengis.net/gml/3.2" xmlns:xAL="urn:oasis:names:tc:ciq:xal:3"
      elementFormDefault="qualified" targetNamespace="http://www.opengis.net/citygml/3.0"
      version="3.0.0">
  <annotation>
    <documentation>The Core module defines the basic components of the CityGML
conceptual model. This includes abstract base classes that define the core properties
of more specialized thematic classes defined in other modules as well as concrete
classes that are common to other modules, for example basic data
types.</documentation>
  </annotation>
  <import namespace="http://www.opengis.net/gml/3.2"
            schemaLocation="http://schemas.opengis.net/gml/3.2.1/gml.xsd"/>
  <import namespace="urn:oasis:names:tc:ciq:xal:3" schemaLocation="http://docs.oasis-
open.org/ciq/v3.0/cs02/xsd/default/xsd/xAL.xsd"/>
  <!--XML Schema document created by ShapeChange - http://shapechange.net/-->
  <element abstract="true" name="ADEOfAbstractAppearance"
            substitutionGroup="gml:AbstractObject" type="core:ADEOfAbstractAppearanceType">

Annex D: Conceptual Model Conformance (Normative)

NOTE This is where conformance with CityGML 3.0 Conceptual Model is documented.

Annex E: Codelists (Informative)

Codelists are tables of attribute values and corresponding description or definition. Values in a specific table may be used for designated properties with the codelist stereotype in the UML Conceptual Model(CM). The CityGML 3.0 CM defines 140 such attributes.

The values for each of these 140 codelist attributes are interpreted in a specific application context. In particular, they may be required, recommended, or suggested by an authority within an organization or community. As a consequence, the lists and contained values are outside the scope of standardization of the CityGML CM or any of its encodings. Since only the values themselves, not the lists or tables, appear in CiotyGML GML-encoded documents, the structure of codelists also lies outside the scope of CityGML CM and Encoding standards. Nevertheless, it is helpful to have some example codelists available for inspection by developers working with a specific encoding. This Annex contains example structures for GML, comma-separated-value (CS), and JSON codelists. SUPplementing these structures, OGC maintains a CityGML 3.0 codelist repository with samples of each of the 140 CityGML 3.0 codelist attributes in GML, CSV, and JSON form at https://data.ogc.org/citygml-swg/3.0/codelist_name.extension , where *codelist_name* is the name of the attribute in the CityGML 3.0 CM UML diagram and *extension* is "xml", "csv", or "json" to indicate the encoding.

E.1. Logical Model

There is no standardized model for CityGML codelists but the following is an example that meets requirements for documenting the source, currency, language, and other characteristics of the list of values. This is the model followed by the CityGML 3.0 codelist examples hosted by OGC.

Figure 26. Suggested Codelist UML Class Diagram

E.2. Examples

E.2.1. GML

This GML encoding of the example logical model for codelists, dictionary entry, and entry metadata have XML schema definitions as follows:

- codelist

codeSpace="https://ogc.org/citygml/3.0/codelists/gml/rooftypes">3100</gml:identifier>
        <gml:name>saddle roof</gml:name>
      </gml:Definition>
    </gml:dictionaryEntry>
  </gml:Dictionary>
</codelist>

```

E.2.2. Comma Separated Values(CSV) Structure

This CSV encoding of the example logical model is illustrated with the following example with the delimiter '|':

```
cdl|description|Roof type values
cdl|identifier|"https://ogc.org/citygml/3.0/codelists/gml/RoofTypeValues"
cmd|authority|Example
cmd|dataType|RoofTypeValue
cmd|language|en-UK
cmd|namespace|"http://www.opengis.net/citygml/building/3.0"
cmd|version|3.0
def|description|roof primarily a single plane, not necessarily level
def|identifier |"https://ogc.org/citygml/3.0/codelists/gml/RoofTypeValues/1000"
def|name|flat roof
def|description|a roof that has a ridge and two gables
def|identifier|"https://ogc.org/citygml/3.0/codelists/gml/RoofTypeValues/3100"
def|name|saddle roof
```

E.2.3. JSON

This JSON encoding of the example logical model for codelists has a JSON-Schema 2019-09 definition as follows:

json-schema file content goes here

The following is an example:

json example goes here

Annex F: Revision History

Date	Release	Editor	Primary clauses modified	Description
2016-04-28	0.1	G. Editor	all	initial version

Annex G: Glossary

conformance test class

set of conformance test modules that must be applied to receive a single certificate of conformance
[OGC 08-131r3, definition 4.4]

feature

abstraction of real world phenomena
[ISO 19101-1:2014, definition 4.1.11]

feature attribute

characteristic of a feature
[ISO 19101-1:2014, definition 4.1.12]

feature type

class of features having common characteristics
[ISO 19156:2011, definition 4.7]

measurement

set of operations having the object of determining the value of a quantity
[ISO 19101-2:2018, definition 3.21] / [VIM:1993, 2.1]

model

abstraction of some aspects of reality
[ISO 19109:2015, definition 4.15]

observation

act of measuring or otherwise determining the value of a property
[ISO 19156:2011, definition 4.11]

observation procedure

method, algorithm or instrument, or system of these, which may be used in making an observation
[ISO 19156:2011, 4.12]

observation result

estimate of the value of a property determined through a known observation procedure
[ISO 19156:2011, 4.14]

property

facet or attribute of an object referenced by a name.
[ISO 19143:2010, definition 4.21]

requirements class

aggregate of all requirement modules that must all be satisfied to satisfy a conformance test class
[OGC 08-131r3, definition 4.19]

schema

formal description of a model
[ISO 19101-1:2014, definition 4.1.34]

sensor

type of observation procedure that provides the estimated value of an observed property at its output

[OGC 08-094r1, definition 4.5]

Standardization Target

TBD

timeseries

sequence of data values which are ordered in time

[OGC 15-043r3]

universe of discourse

view of the real or hypothetical world that includes everything of interest

[ISO 19101-1:2014, definition 4.1.38]

version

Particular variation of a spatial object

[INSPIRE Glossary]

G.1. ISO Concepts

The following concepts from the ISO TC211 Harmonized UML model are referenced by the CityGML Conceptual UML model but do not play a major role in its' definition. They are provided here to support a more complete understanding of the model.

Area

The measure of the physical extent of any topologically 2-D geometric object. Usually measured in "square" units of length.

[\[ISO 19103:2015\]](#)

Boolean

boolean is the mathematical datatype associated with two-valued logic

[\[ISO 19103:2015\]](#)

CC_CoordinateOperation

mathematical operation on coordinates that transforms or converts coordinates to another coordinate reference system.

[\[ISO 19111:2019\]](#)

Character

symbol from a standard character-set.

[\[ISO 19103:2015\]](#)

CharacterString

Characterstring is a family of datatypes which represent strings of symbols from standard character-sets.

[\[ISO 19103:2015\]](#)

CRS

Coordinate reference system which is usually single but may be compound.

[[ISO 19111:2019](#)]

CV_DiscreteCoverage

A subclass of CV_Coverage that returns a single record of values for any direct position within a single geometric object in its spatiotemporal domain.

[[ISO 19123:2005](#)]

CV_DomainObject

[[ISO 19123:2005](#)]

CV_GridPointValuePair

[[ISO 19123:2005](#)]

CV_GridValuesMatrix

The geometry represented by the various offset vectors is in the image plane of the grid.

[[ISO 19123:2005](#)]

CV_ReferenceableGrid

[[ISO 19123:2005](#)]

Date

Date gives values for year, month and day. Representation of Date is specified in ISO 8601. Principles for date and time are further discussed in ISO 19108.

[[ISO 19103:2015](#)]

DateTime

A DateTime is a combination of a date and a time types. Representation of DateTime is specified in ISO 8601. Principles for date and time are further discussed in ISO 19108.

[[ISO 19103:2015](#)]

Distance

Used as a type for returning distances and possibly lengths.

[[ISO 19103:2015](#)]

Engineering CRS

A contextually local coordinate reference system which can be divided into two broad categories:

1. earth-fixed systems applied to engineering activities on or near the surface of the earth;
2. CRSSs on moving platforms such as road vehicles, vessels, aircraft or spacecraft.

[[ISO 19111:2019](#)]

Generic Name

Generic Name is the abstract class for all names in a NameSpace. Each instance of a GenericName is either a LocalName or a ScopedName.

[[ISO 19103:2015](#)]

Geometry

[[ISO 19107:2003](#)]

GM_CompositePoint

[ISO 19107:2003]

GM_CompositeSolid

set of geometric solids adjoining one another along common boundary geometric surfaces

[ISO 19107:2003]

GM_GenericSurface

GM_Surface and GM_SurfacePatch both represent sections of surface geometry, and therefore share a number of operation signatures. These are defined in the interface class GM_GenericSurface.

[ISO 19107:2003]

GM_LineString

consists of sequence of line segments, each having a parameterization like the one for GM_LineSegment

[ISO 19107:2003]

GM_MultiPrimitive

[ISO 19107:2003]

GM_OrientableSurface

a surface and an orientation inherited from GM_OrientablePrimitive. If the orientation is "+", then the GM_OrientableSurface is a GM_Surface. If the orientation is "-", then the GM_OrientableSurface is a reference to a GM_Surface with an upNormal that reverses the direction for this GM_OrientableSurface, the sense of "the top of the surface".

[ISO 19107:2003]

GM_PolyhedralSurface

a GM_Surface composed of polygon surfaces (GM_Polygon) connected along their common boundary curves.

[ISO 19107:2003]

GM_Position

a union type consisting of either a DirectPosition or of a reference to a GM_Point from which a DirectPosition shall be obtained.

[ISO 19107:2003]

GM_Primitive

The abstract root class of the geometric primitives. Its main purpose is to define the basic "boundary" operation that ties the primitives in each dimension together.

[ISO 19107:2003]

Integer

An exact integer value, with no fractional part.

[ISO 19103:2015]

Internet of Things

The network of physical objects--"things"--that are embedded with sensors, software, and other technologies for the purpose of connecting and exchanging data with other devices and systems over the Internet.

IO_IdentifiedObjectBase

[\[ISO 19103:2015\]](#)

Length

The measure of distance as an integral, i.e. the limit of an infinite sum of distances between points on a curve.

[\[ISO 19103:2015\]](#)

Measure

The result from performing the act or process of ascertaining the extent, dimensions, or quantity of some entity.

[\[ISO 19103:2015\]](#)

Number

The base type for all number data, giving the basic algebraic operations.

[\[ISO 19103:2015\]](#)

Point

GM_Point is the basic data type for a geometric object consisting of one and only one point.

[\[ISO 19107:2003\]](#)

Real

The common binary Real finite implementation using base 2.

[\[ISO 19103:2015\]](#)

RS_ReferenceSystem

Description of a spatial and temporal reference system used by a dataset.

[\[ISO 19111:2019\]](#)

Scoped Name

ScopedName is a composite of a LocalName for locating another NameSpace and a GenericName valid in that NameSpace. ScopedName contains a LocalName as head and a GenericName, which might be a LocalName or a ScopedName, as tail.

[\[ISO 19103:2015\]](#)

Solid

GM_Solid, a subclass of GM_Primitive, is the basis for 3-dimensional geometry. The extent of a solid is defined by the boundary surfaces.

[\[ISO 19107:2003\]](#)

Time

Time is the designation of an instant on a selected time scale, astronomical or atomic. It is used in the sense of time of day.

[\[ISO 19103:2015\]](#)

TM_Duration

[\[ISO 19108:2006\]](#)

TM_TemporalPosition

The position of a TM_Instant relative to a TM_ReferenceSystem.

[ISO 19108:2006]

Unit of Measure

Any of the systems devised to measure some physical quantity such distance or area or a system devised to measure such things as the passage of time.

[ISO 19103:2015]

URI

Uniform Resource Identifier (URI), is a compact string of characters used to identify or name a resource

[ISO 19103:2015]

Volume

Volume is the measure of the physical space of any 3-D geometric object.

[ISO 19103:2015]
